1. Introduction

1.1. Purpose

Capstone projects often fail due to students' poor time management, disorganized submissions, and last-minute work across multiple deliverables. Faculty advisers also struggle with manually tracking various groups, monitoring deadlines, reviewing submissions, and providing timely feedback. Existing platforms such as LMSs and academic portals offer only basic file submission and storage. They lack milestone-based tracking, automated reminders, version control, risk detection, and structured feedback loops specifically designed for capstone workflows.

The purpose of this document is to serve as a reference for developers, project advisers, and stakeholders by clearly describing how the system should behave, what features it must include, and the constraints under which it operates.

IntelliTrack aims to improve capstone project workflows by providing:

- Automated milestone tracking
- AI-assisted deadline reminders
- Centralized document submission
- Real-time monitoring of deliverables
- Analytics dashboards for instructors and coordinators

By implementing these features, the system enhances student accountability, reduces administrative workload, and improves overall capstone project management.

1.2. Scope

IntelliTrack is a web-based capstone deliverables submission tracking and analytics system designed to help academic institutions monitor student progress through structured milestone

tracking, submission management, and analytical reporting.

The system enables students, advisers, coordinators, and administrators to access a centralized platform where capstone deliverables are monitored according to defined deadlines and submission requirements.

IntelliTrack focuses on improving submission compliance, project monitoring, document management, and institutional oversight through AI-assisted analytics and automated monitoring services.

The platform supports the following core capabilities:

- Secure role-based user authentication using institutional Gmail accounts
- Class and deliverable configuration by administrators and coordinators
- Monitoring of milestone deadlines and submission timelines
- AI-assisted reminder notifications and risk monitoring
- Submission file upload and version management
- Adviser evaluation and rubric-based feedback
- Real-time submission analytics dashboards
- Audit logging and anomaly detection monitoring
- Institutional reporting and submission oversight

Students can upload deliverables, monitor deadlines, track submission progress, review adviser feedback, and manage submission revisions. Advisers and coordinators can evaluate deliverables, monitor group performance, review submission analytics, and generate AI-assisted submission summaries.

The system is designed as a specialized capstone management and analytics platform and is not intended to replace a full Learning Management System (LMS). Instead, IntelliTrack serves as a dedicated monitoring, submission tracking, and institutional analytics solution for capstone project management.

1.3. Definitions, Acronyms and Abbreviations

Acronym & Abbreviations	**Definition**
AI	Artificial Intelligence

RBAC	Role-Based Access Control
LMS	Learning Management System
UI	User Interface
UX	User Experience
CRUD	Create, Read, Update, Delete (basic operations in software systems)
CDSS	Capstone Deliverables Submission System
Milestone	A required capstone deliverable with a specific deadline (e.g., Proposal, Midterm, Final)
Version Control	A system that tracks document versions, changes, and submission histories
Analytics Dashboard	A visual interface showing real-time submission status and progress insights
Inline Feedback	Comments or annotations placed directly on a student's submitted document

2. Overall Description

2.1. Product perspective

Capstone projects require students to complete multiple deliverables within strict academic timelines. However, many institutions still rely on manual tracking methods or general learning management systems that lack dedicated monitoring, analytics, version management, and institutional oversight tools specifically designed for capstone workflows.

IntelliTrack is designed as a specialized capstone deliverables tracking and analytics system focused on milestone monitoring, submission management, AI-assisted analytics, and institutional oversight.

The system provides:

- Automated deadline monitoring
- Submission timestamp tracking
- AI-assisted risk monitoring
- Version-controlled document management
- Adviser evaluation and rubric-based feedback
- Real-time analytics dashboards
- Audit logging and anomaly detection services

The platform operates as a cloud-based web application using a client-server architecture. Users access the system through a web browser while backend services process authentication, analytics computation, submission management, audit monitoring, and AI-assisted notifications.

IntelliTrack integrates with external services such as:

- Google OAuth Authentication

- Cloud storage APIs
- Email notification services
- Analytics and AI processing services

The system uses:

- React.jsx for frontend development
- Spring Boot (Java) for backend services
- JWT-based authentication and authorization
- Cloud-hosted databases and storage services

By combining submission monitoring, AI-assisted analytics, version control, and institutional oversight, IntelliTrack provides real-time visibility into capstone progress and submission compliance.

2.2. User characteristics

The IntelliTrack system provides several core functions designed to support **capstone deliverable tracking and analytics monitoring**.

- **User Authentication and Role Management**

  The system authenticates users through institutional Gmail accounts and assigns roles such as student, adviser, coordinator, or administrator.

- **Class and Deliverable Management**

  Administrators can create classes and define deliverables with specific deadlines to structure the capstone workflow.

- **Submission Tracking**

  Students can upload deliverables while the system records submission timestamps and automatically determines whether submissions are on time, pending, or late.

- **Deadline Monitoring**

  The system continuously monitors deadlines and generates reminders to help students submit deliverables on time.

- **Time-Based Analytics**

  Submission data is analyzed to generate insights such as submission trends, late submission rates, and overall compliance with deadlines.

- **Analytics Dashboard**

  Advisers and coordinators can access dashboards that visualize submission statistics and provide insights into student and group performance.

2.4. Constraints

The development and deployment of **IntelliTrack** are subject to the following constraints:

Regulatory Policies

- Must comply with institutional academic policies
- Must follow data privacy regulations such as Data Privacy Act of 2012 (Philippines)
- FERPA/GDPR alignment when applicable

Hardware & Software Limitations

- Requires stable internet access
- Dependent on availability of cloud hosting
- Performance may vary with large file uploads

Interface Constraints

- Must integrate with institutional email systems
- Must support document formats (PDF, DOCX, PPTX)
- Connection with cloud storage API

Parallel Operation

- Must support simultaneous access from multiple users (students, advisers, admins)
- Should maintain performance at 500-1000 and more concurrent users

Audit & Logging Requirements

- Must maintain audit trails for all submissions, edits, role changes, and feedback
- Logs should be immutable for academic integrity

Control Functions

- Version control must prevent document overwriting
- System must enforce role-based restrictions

Reliability Requirements

- Target uptime: **99.9% availability**
- Automated backups and recovery plans required

Criticality

- High academic impact: failure may affect grading and submission deadlines
- Must ensure reliable access, especially near milestone deadlines

Safety & Security Considerations

- Encrypted document storage
- Role-based access control
- Anomaly detection for suspicious activity
- Secure authentication for faculty accounts

2.5. Assumptions and dependencies

Assumptions

The following conditions are assumed to be true for the **IntelliTrack** to operate as intended:

- Users have stable internet access and use modern browsers (Chrome, Edge, Firefox, Safari).
- Institutional administrators will provide accurate academic schedules, deadlines, user lists, and role assignments.
- Students and faculty are familiar with uploading and downloading digital documents.
- Institutional email services are available and functioning for authentication and account verification.
- Cloud hosting services (e.g., Azure, AWS) remain operational and available.
- All users access the system with their assigned institution-based accounts.
- Advisers and coordinators provide timely feedback and updates to ensure analytics remain accurate.
- Document uploads follow accepted formats (PDF, DOCX, PPTX) as defined by institutional policies.
- Users have devices capable of accessing the system (PC, laptop, or mobile device).
- File sizes uploaded by students are within allowed storage limitations.
- System maintenance schedules are coordinated and communicated in advance to avoid academic disruptions.
- Institutional policies regarding data retention, privacy, and academic conduct remain stable throughout development.

Dependencies

The **IntelliTrack** relies on the following external systems, technologies, and conditions:

- Availability and reliability of the cloud database (e.g., Supabase) for storing

submissions, logs, and metadata.

- AI-generated reminders and risk detection depend on accurate and complete data inputs (deadlines, submission timestamps, user activity).
- Document management, version control, and rollback features rely on third-party storage APIs and cloud file systems.
- Real-time analytics and reporting depend on uninterrupted logging services and complete submission records.
- Security features depend on the hosting provider's infrastructure for encryption, secure authentication, and intrusion detection.
- Email notification services must remain available.
- Integration with institutional systems (e.g., student information systems, email servers) must remain functional.
- System performance depends on the scalability and responsiveness of the hosting platform.
- Mobile access depends on device compatibility and browser support for responsive UI components.
- Backup and recovery procedures depend on cloud provider backup services.
- Future upgrades may depend on API updates or changes from third-party providers.
- The development team relies on version control tools (e.g., GitHub) for stable collaboration and deployment pipelines.

3. Specific Requirements

3.1. External interface requirements

3.1.1. Hardware interfaces

Client Devices:

- **Devices Supported:** The system must be accessible on any device with a modern browser, including PC, laptop, or mobile device (though the UI/UX is tailored for desktop compatibility).
- **User Interface (UI) Support:** The system requires full-screen support and must render a simple, intuitive interface with easy navigation across different screen resolutions (responsive design is implied for cross-platform compatibility).
- **Input/Output:** Standard input devices (keyboard, mouse/touchpad) are required for login, document upload, and inputting inline comments/rubric evaluations.

Deployment & Hosting:

- **Server Hardware:** The system requires Cloud hosting with database support.
- **Performance Configuration:** The underlying server hardware must be provisioned to handle at least 1,000 concurrent users and maintain a response time of < 2 seconds.

3.1.2. Software interfaces

Required Software Products (Core Stack)

Operating System

The system must support standard operating systems capable of running modern web browsers including:

- Windows
- Linux

- macOS

Frontend Framework

The system shall use:

- React.jsx for frontend user interface development

Backend Framework

The system shall use:

- Spring Boot (Java) for backend business logic and API services

Authentication and Security

The system shall implement:

- Google OAuth2 Authentication
- JWT-based authentication and authorization
- Role-Based Access Control (RBAC)

Database Management

The system shall use:

- Cloud-hosted relational databases for structured data storage
- Cloud storage services for file and document management

Version Control

The development team shall use:

- GitHub for collaborative development and version management

Interfaces with Other Systems

Institutional Email Systems

The system shall integrate with institutional email services for:

- Authentication
- Account validation
- Automated notifications
- Reminder alerts

Cloud Storage Services

The system shall connect with cloud storage APIs for:

- Submission file management
- Version control
- File retrieval
- Backup storage

AI and Analytics Services

The system shall interface with AI-assisted analytics services for:

- Submission risk detection
- Smart reminders
- Submission summaries
- Analytics reporting

Notification Services

The system shall integrate with notification and email services for:

- Deadline reminders
- Submission alerts
- Adviser feedback notifications
- Institutional monitoring alerts

3.1.3. Communications interfaces

Network Access: The system requires **stable internet access** as it is a web-based, cloud-hosted application.

Protocols and Security:

- **Data Encryption:** Requires protocols to ensure **end-to-end encryption for stored and transmitted data**.
- **Authentication Protocol:** Must integrate with institutional authentication protocols to use **institutional email** and support **Multi-Factor Authentication (MFA)** for advisers and administrators.
- **Email Protocol:** The system relies on **Email notification services (SMTP or third-party services)** for sending alerts and reminders.
- **API Communication:** Communication protocols are needed for the **connection with cloud storage API** and other external services (analytics, institutional systems).

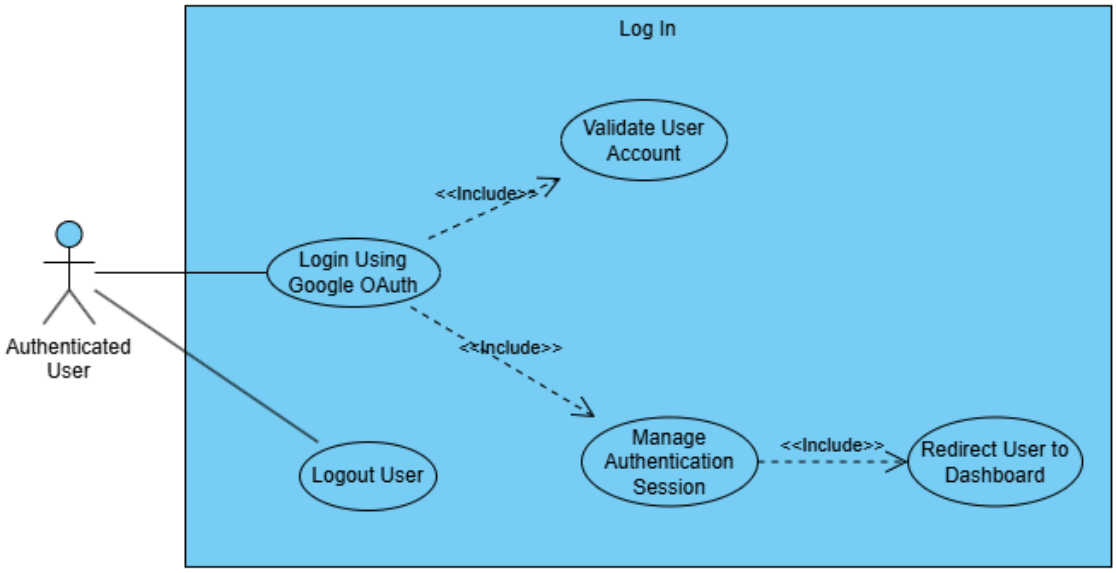

3.2. Functional requirements

Module 1: User Management System

1.1 Log In

- *Use Case Diagram*

Made with Visual Paradigm
For non-commercial use

- *Use Case Description*

The system shall provide a secure authentication mechanism using institutional Google accounts through Google OAuth integration. Users shall be required to log in using their authorized institutional email addresses before accessing the system.

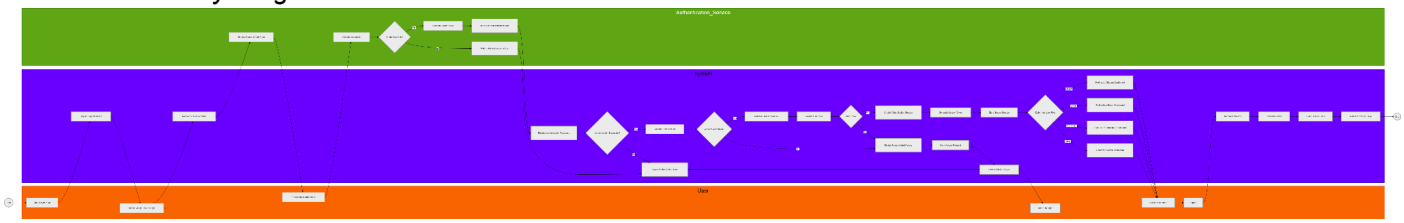

When a user initiates the login process, the system shall redirect the user to the Google OAuth authentication service to verify account credentials securely. After successful authentication, the system shall retrieve the user's account information from the database and validate the assigned institutional role.

The system shall identify whether the authenticated user is a Student, Adviser, Coordinator, or Administrator and shall generate a secure session token for authorized

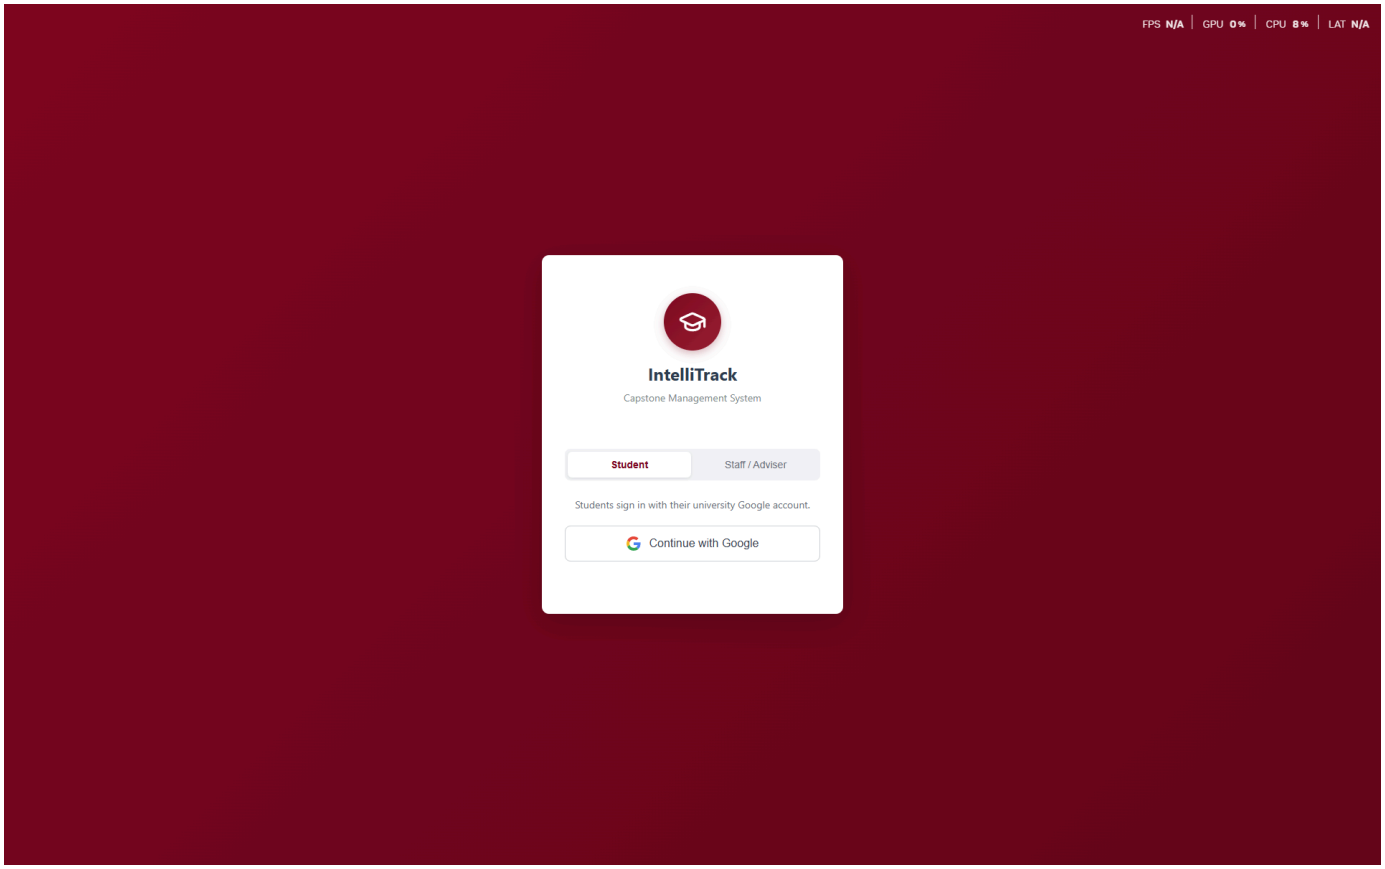

access. Based on the identified role, the system shall redirect the user to the appropriate dashboard interface with role-specific permissions and accessible modules.

If authentication fails, the system shall display appropriate error messages and allow the user to retry the login process. The system shall also prevent unauthorized access attempts and maintain secure session management throughout the user session.

- *Activity Diagram*

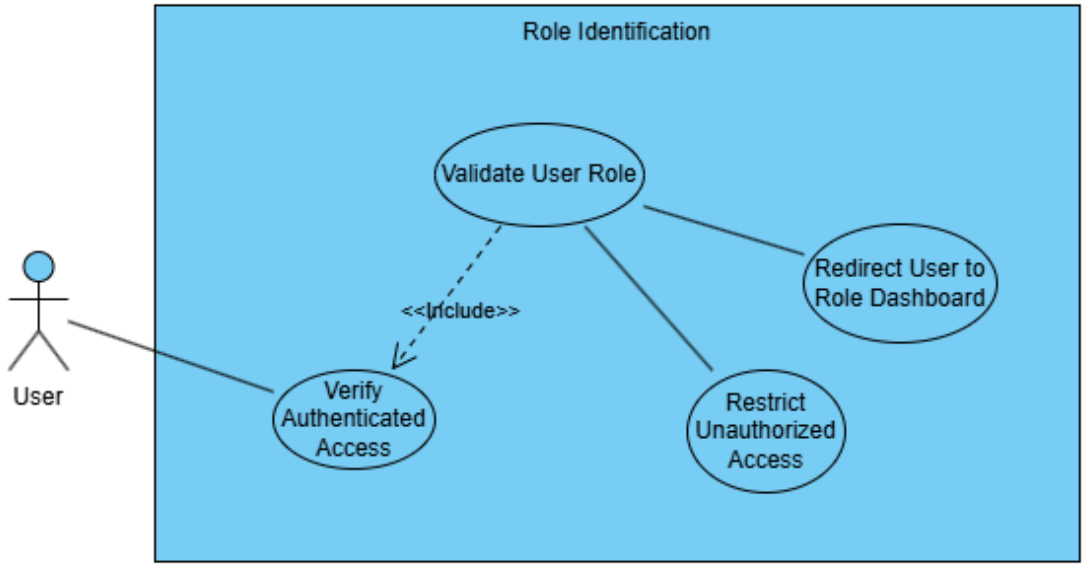

- *Wireframe*

*1.2 **Role Identification***

- *Use Case Diagram*

Made with VisualParadigm
For non-commercial use

- *Use Case Description*

The system shall automatically determine and assign user roles during the authentication and account validation process. After successful login, the system shall retrieve user records and identify the corresponding role based on stored account and organizational information.

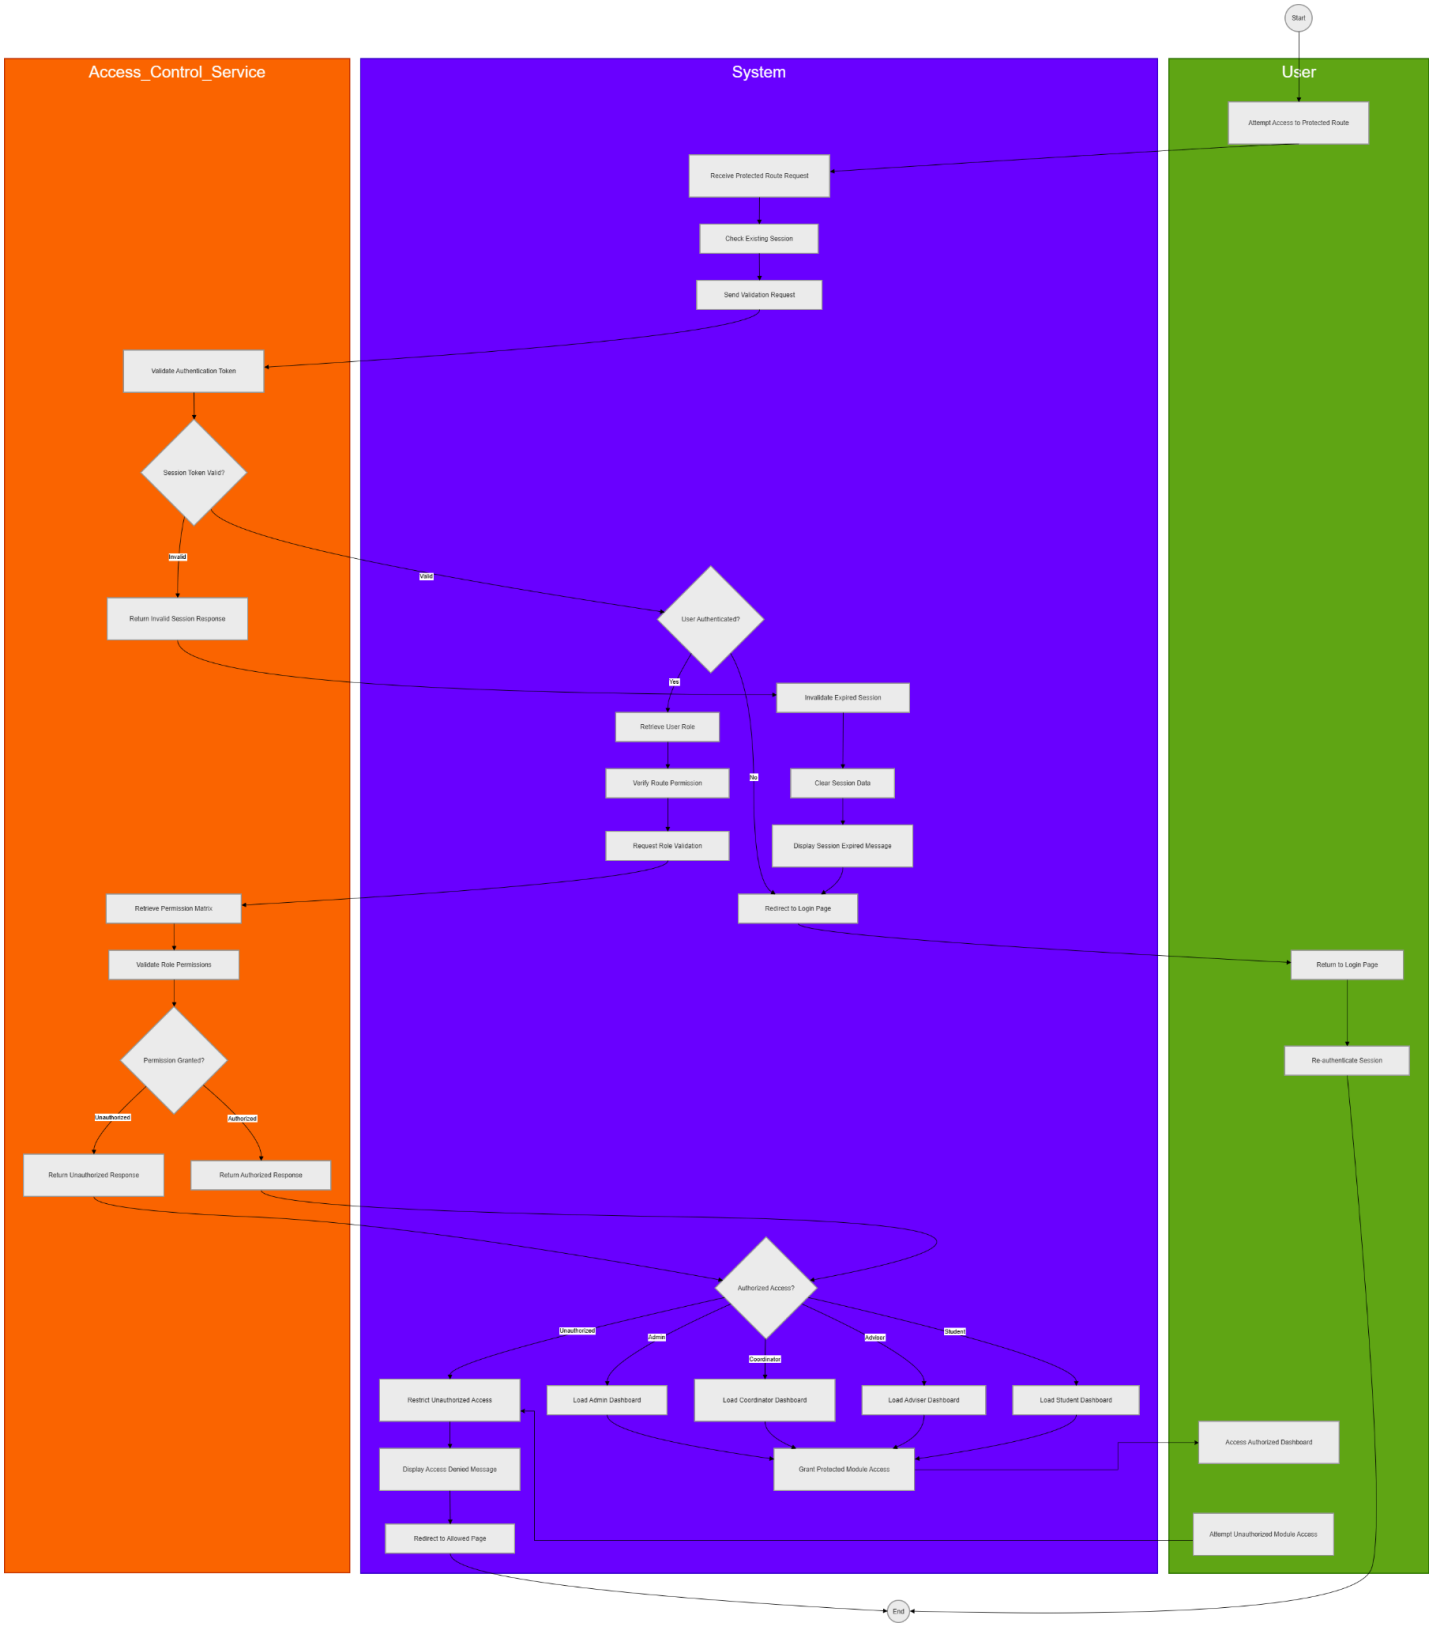

The system shall support role-based access control for Students, Advisers, Coordinators, and Administrators. Each role shall have designated permissions, accessible modules, and authorized operations within the platform.

The system shall restrict unauthorized access to protected features, records, and administrative functions. Users shall only be allowed to access modules and

actions that are permitted under their assigned role.

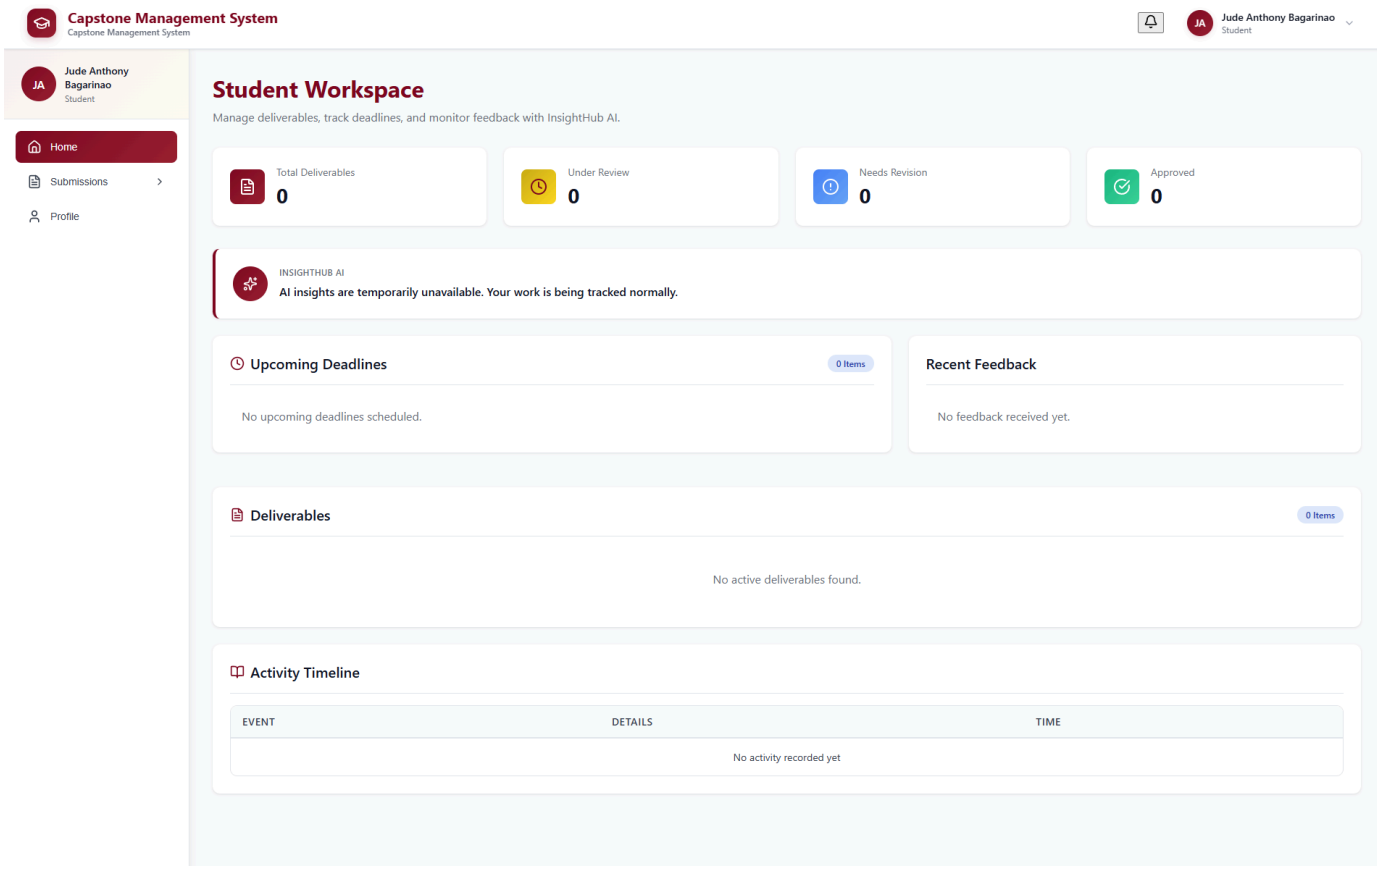

The system shall maintain role association records and allow administrators to manage and update user roles when necessary to support institutional management and operational flexibility.

*1.3 **Profile Management***

- *Use Case Diagram*

Made with Visual Paradigm
For non-commercial use

- *Use Case Description*

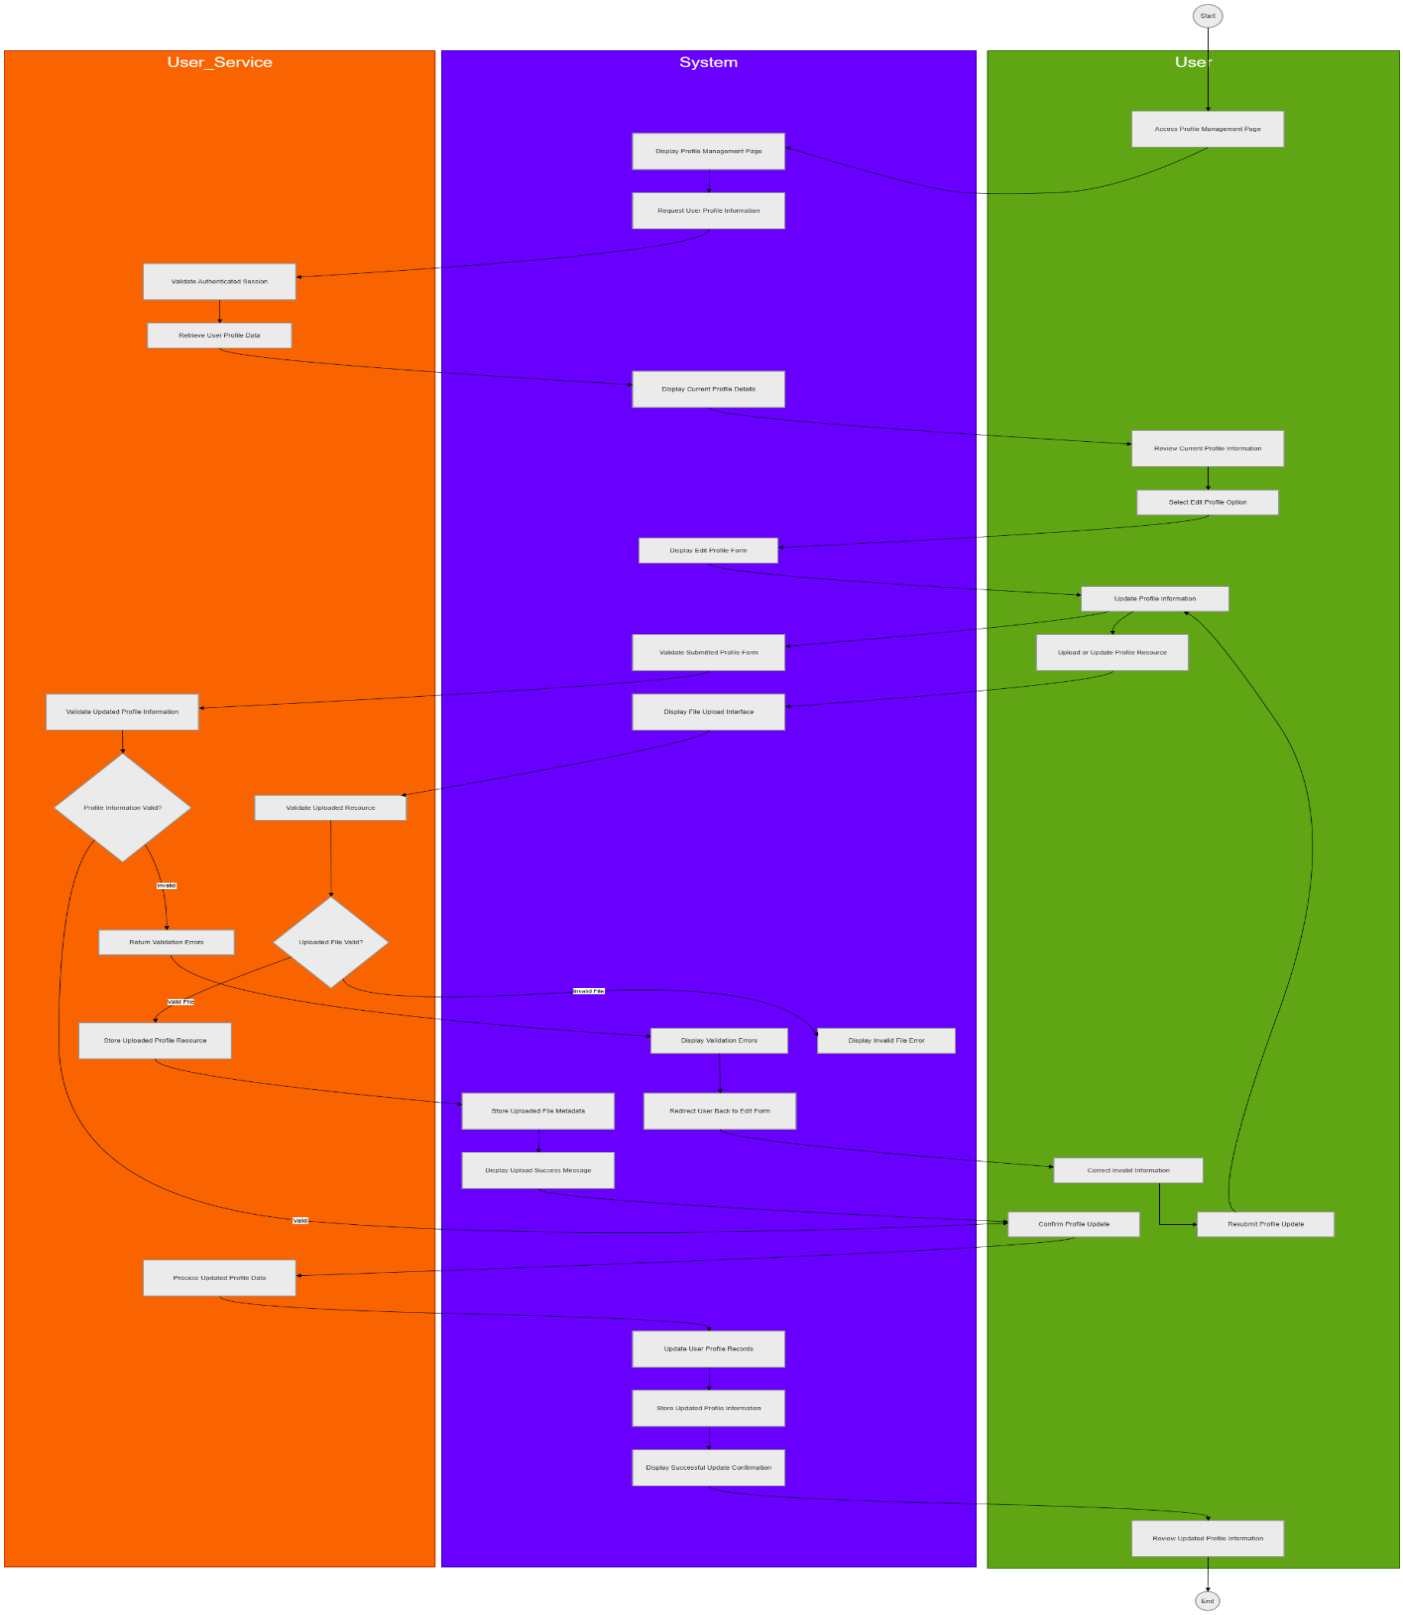

The system shall provide users with profile management functionalities that allow viewing and updating of personal account information. Authorized users shall be able to manage profile details such as name, institutional email, department, assigned group, and account settings.

The system shall validate all updated profile information before saving modifications to the database. Administrators shall have permission to manage user accounts, assign institutional affiliations, and update role-related information when necessary.

The system shall maintain profile update records to support account management,

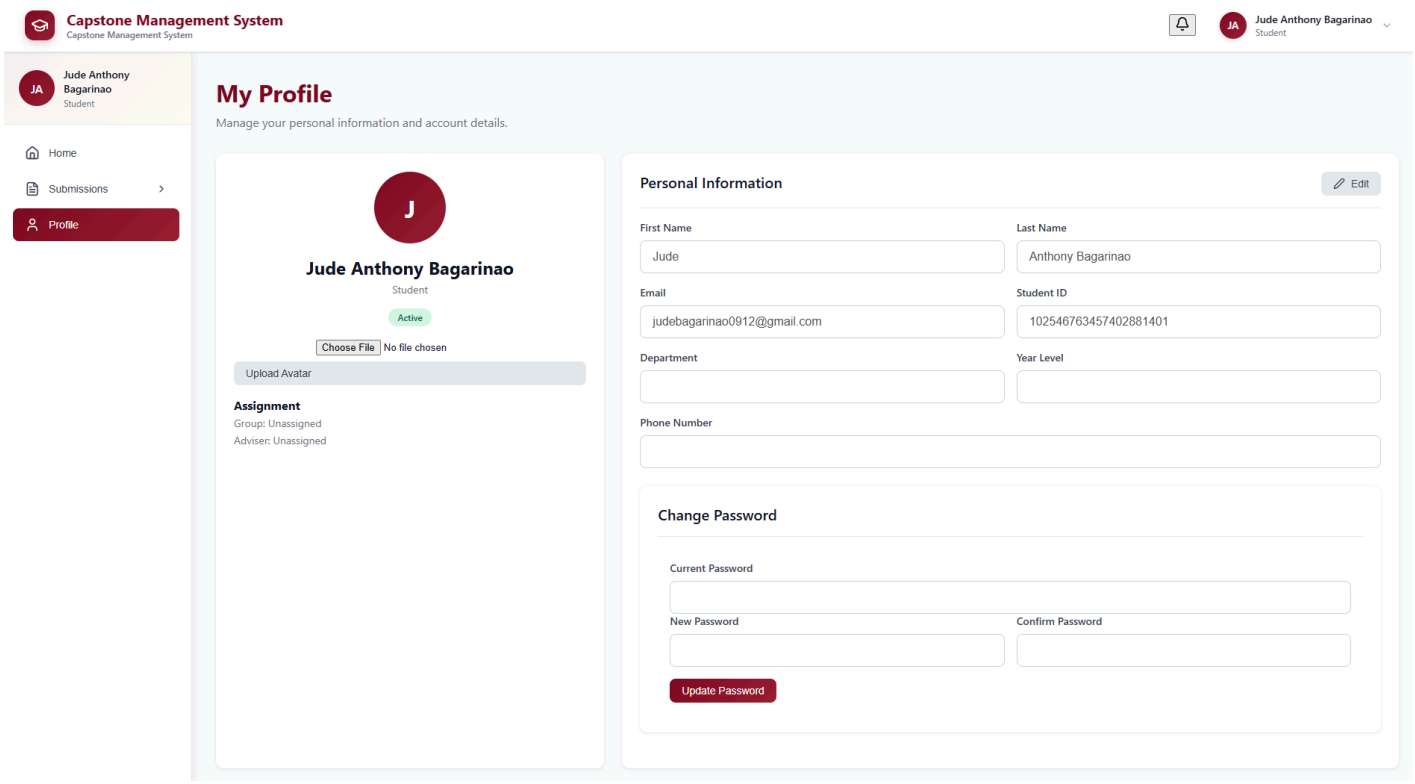

monitoring, and institutional documentation. Users shall also be able to review their assigned role and associated academic or organizational information through the profile interface.

Module 2: Submission Tracker

2.1 ***Deadline Monitoring***

- *Use Case Diagram*

Made with VisualParadigm
For non-commercial use

- *Use Case Description*

The system shall continuously monitor configured submission deadlines and compare them with the current system date and time. It shall display countdown timers and deadline indicators for each assigned deliverable to help users track submission

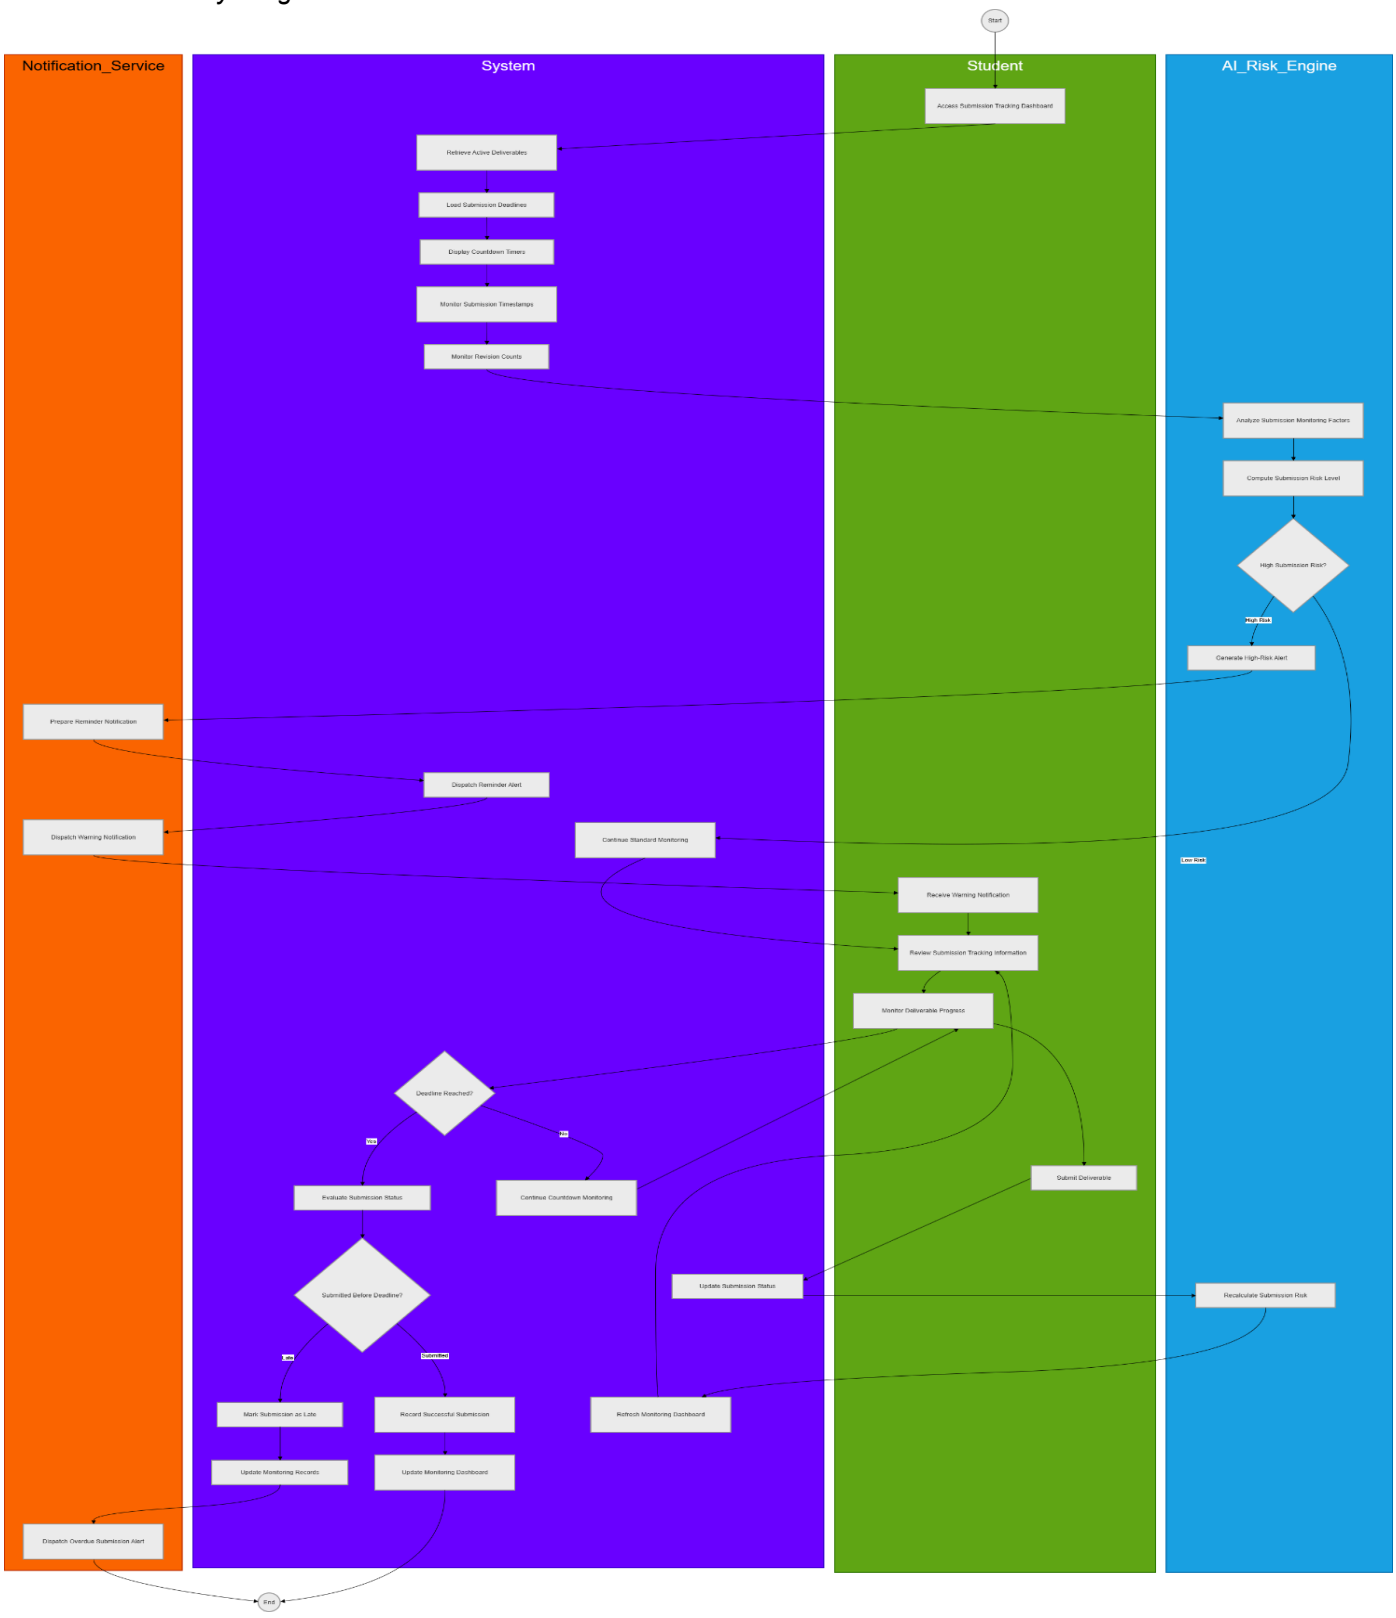

schedules.

The system shall generate automated reminders and notifications when submission deadlines are approaching, overdue, or recently updated. Notification services shall support timely communication between students, advisers, and coordinators regarding submission schedules.

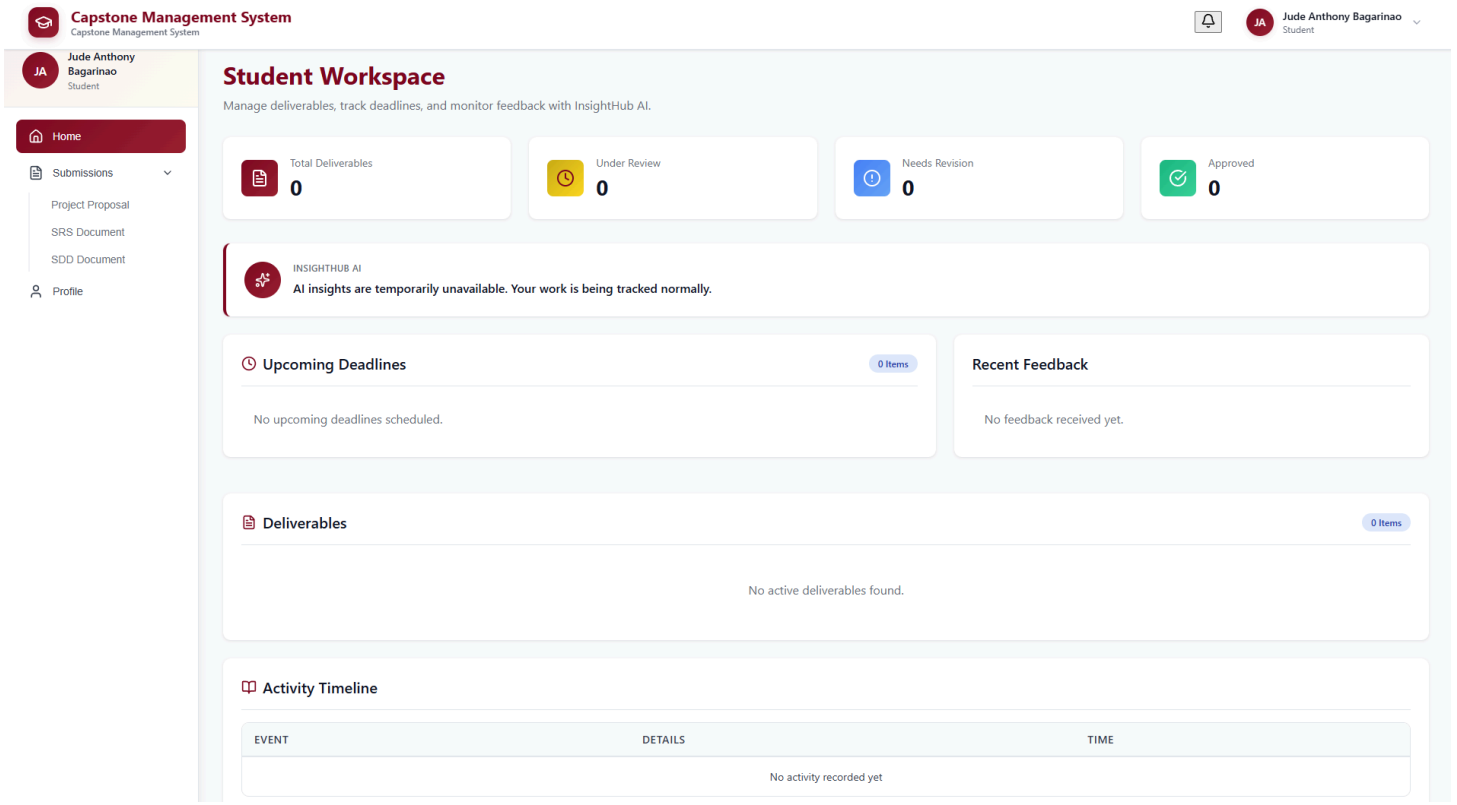

The system shall support AI-assisted notification mechanisms capable of analyzing submission behavior and generating personalized reminder recommendations to encourage timely completion of deliverables.

The system shall maintain deadline records and notification history to support submission monitoring, academic compliance, and institutional coordination.

*2.2 **Status Monitoring***

- *Use Case Diagram*

Made with VisualParadigm
For non-commercial use

- *Use Case Description*

The system shall provide real-time monitoring of submission statuses for all assigned deliverables. It shall retrieve submission records and compare submission timestamps with configured deadlines to determine the current submission state.

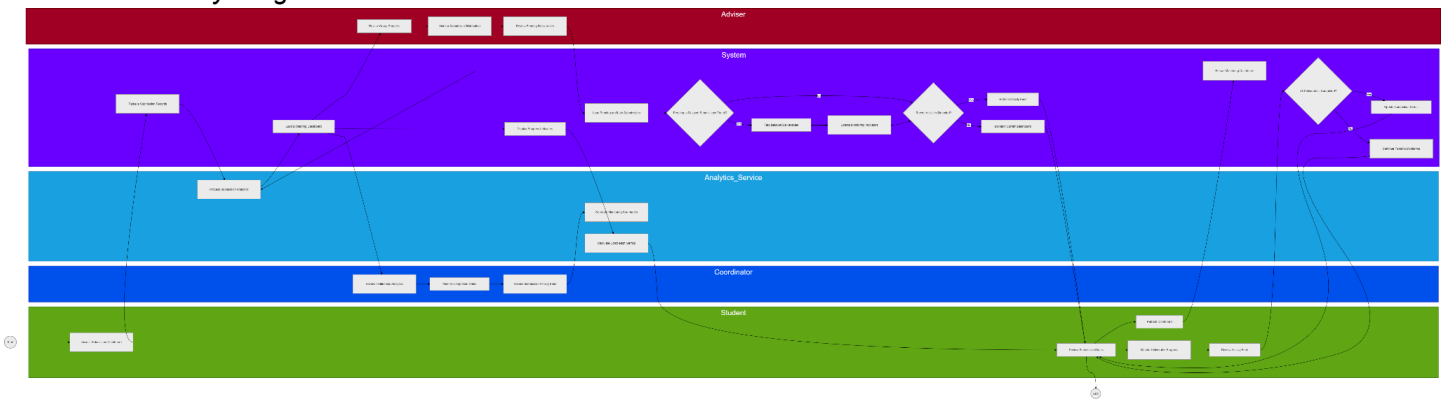

The system shall display submission statuses including Submitted, Pending, Late,

Approved, Rejected, and Under Review. For overdue submissions, the system shall calculate and display the number of delayed days.

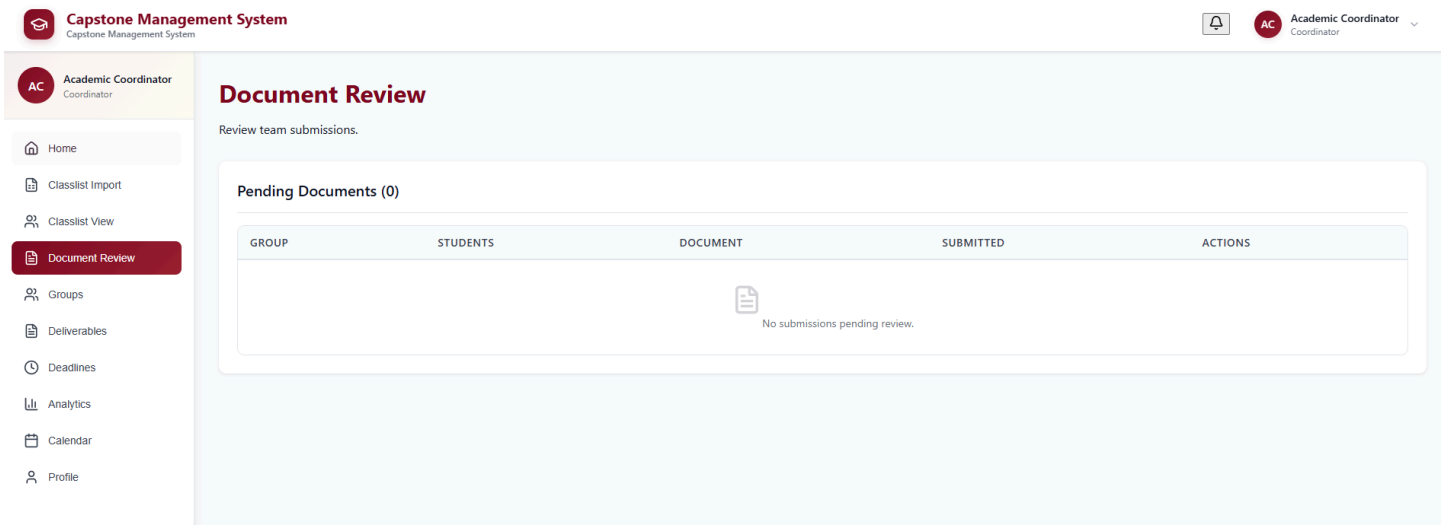

Advisers, coordinators, and students shall be able to monitor individual and group submission progress through centralized tracking interfaces. The system shall automatically update status information whenever submission-related activities occur.

The system shall maintain status history records to support monitoring, academic evaluation, accountability, and institutional reporting.

- *Activity Diagram*

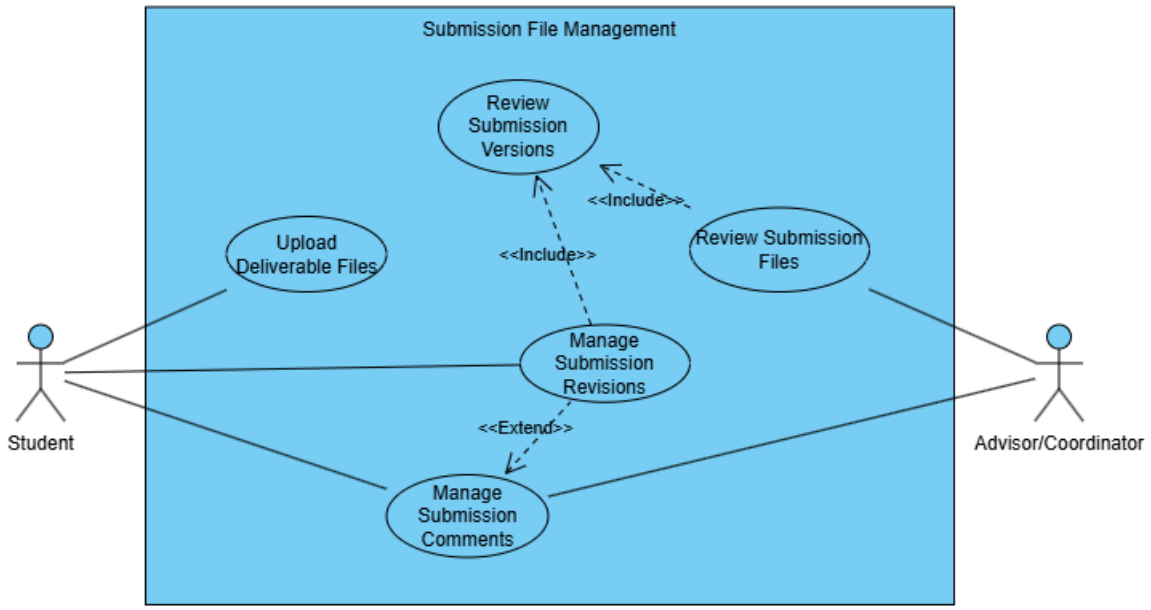

- *Wireframe*

*2.3 **Submission File Management***

- *Use Case Diagram*

Made with Visual Paradigm
For non-commercial use

- *Use Case Description*

  The system shall provide advisers with a rubric-based evaluation and feedback management system for reviewing submitted deliverables.

  Advisers shall be able to:

  - Review uploaded submissions
  - Evaluate deliverables using predefined rubrics
  - Assign criterion-based scores
  - Provide textual feedback and recommendations
  - Approve or reject submissions

  The system shall support detailed rubric configurations consisting of:

  - Rubric categories
  - Evaluation criteria
  - Score allocations

- Assessment descriptions

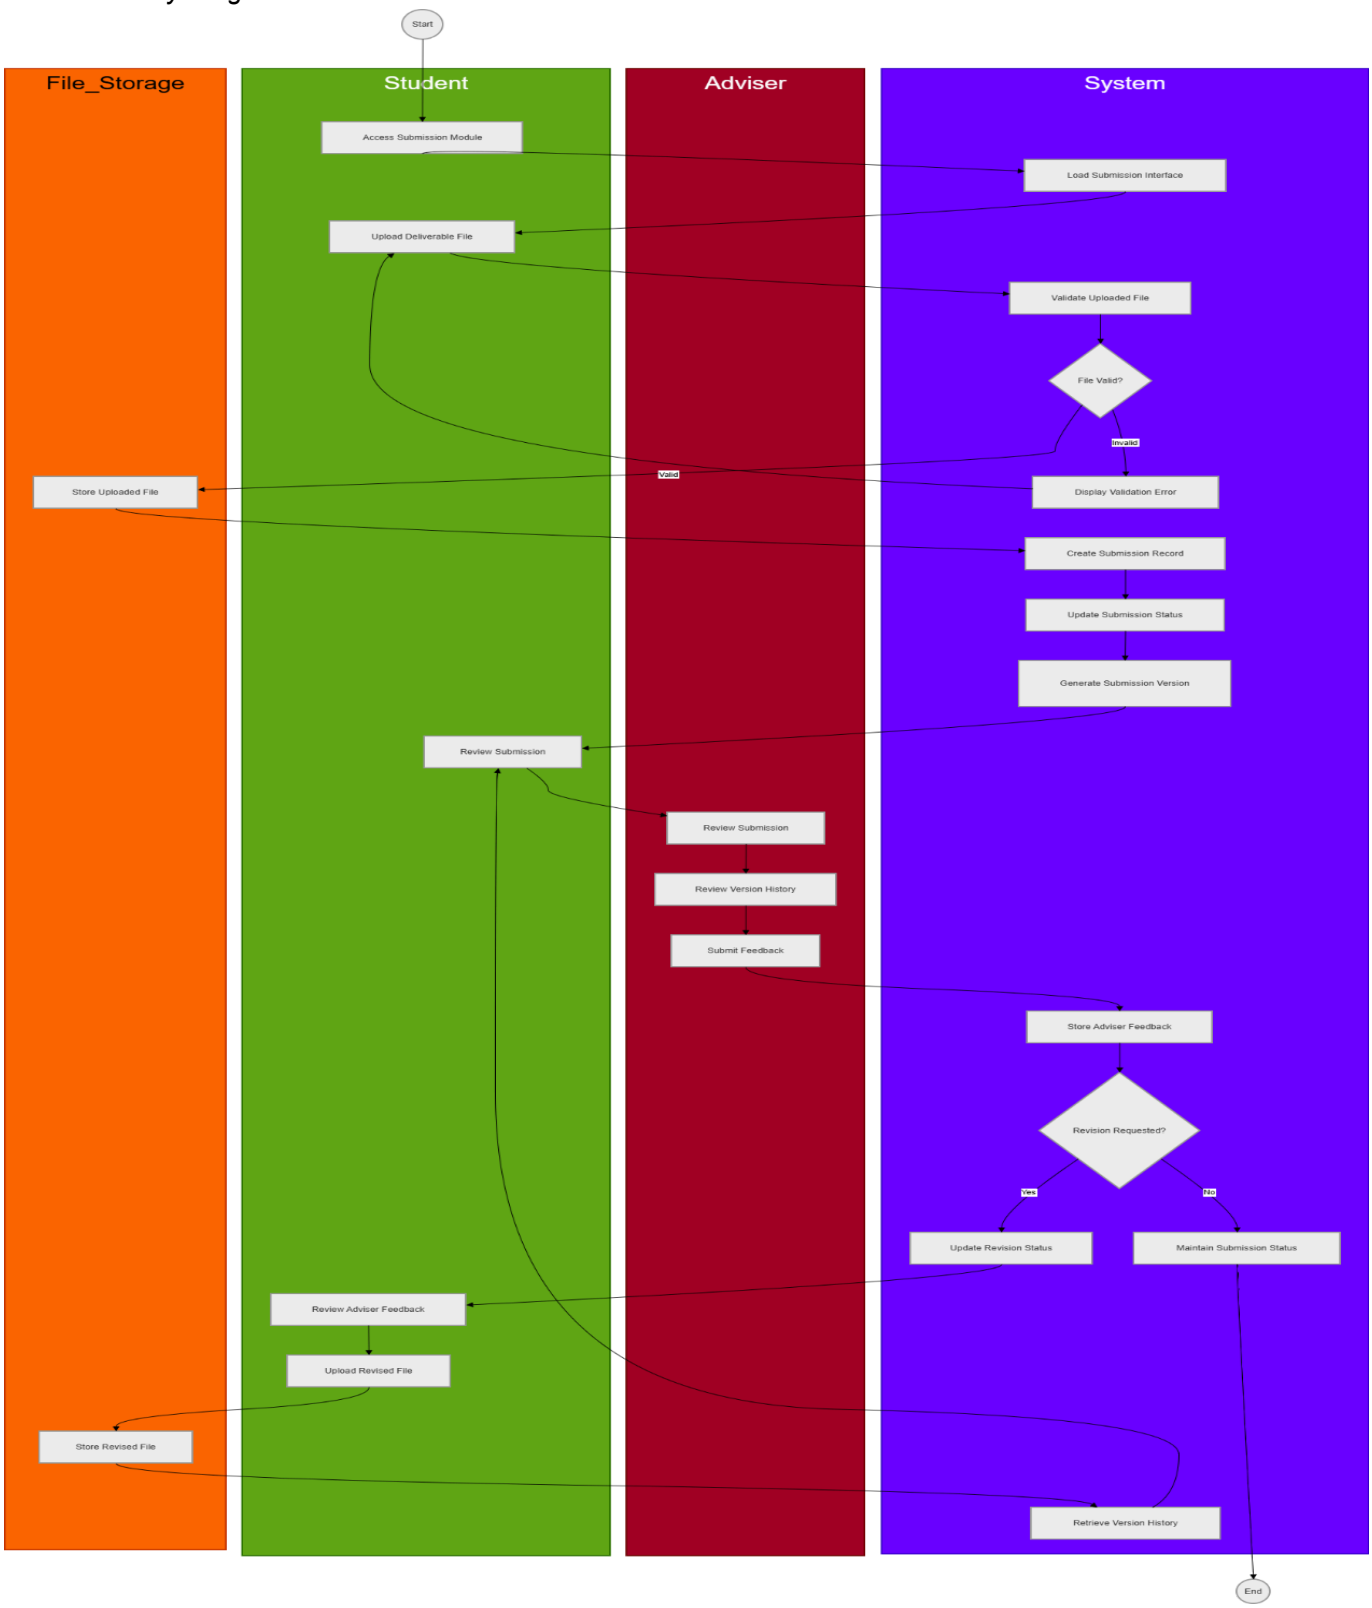

The system shall calculate evaluation scores automatically based on adviser-selected rubric criteria and store evaluation records within the database.

Students shall be able to:

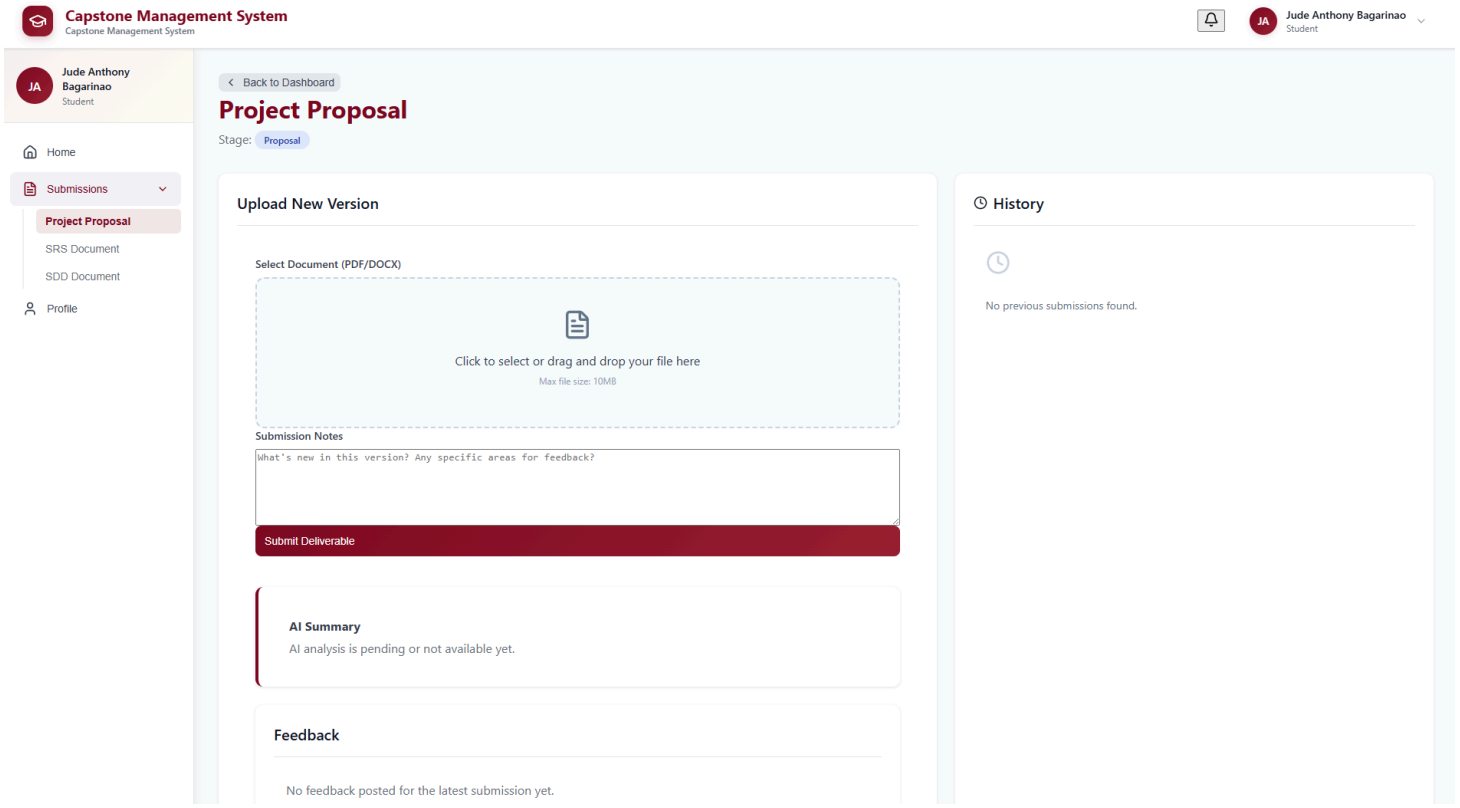

- View adviser evaluations
- Review rubric scores
- Access submission comments
- Monitor revision recommendations

The system shall maintain evaluation history and feedback records to support monitoring, accountability, and institutional documentation.

Module 3: Analytics & Reporting Dashboard

3.1 AI-Powered Real-Time Submission Insights

- *Use Case Diagram*

Made with VisualParadigm
For non-commercial use

- *Use Case Description*

The system shall provide advisers with an AI-powered analytics dashboard capable of delivering real-time submission insights and monitoring information.

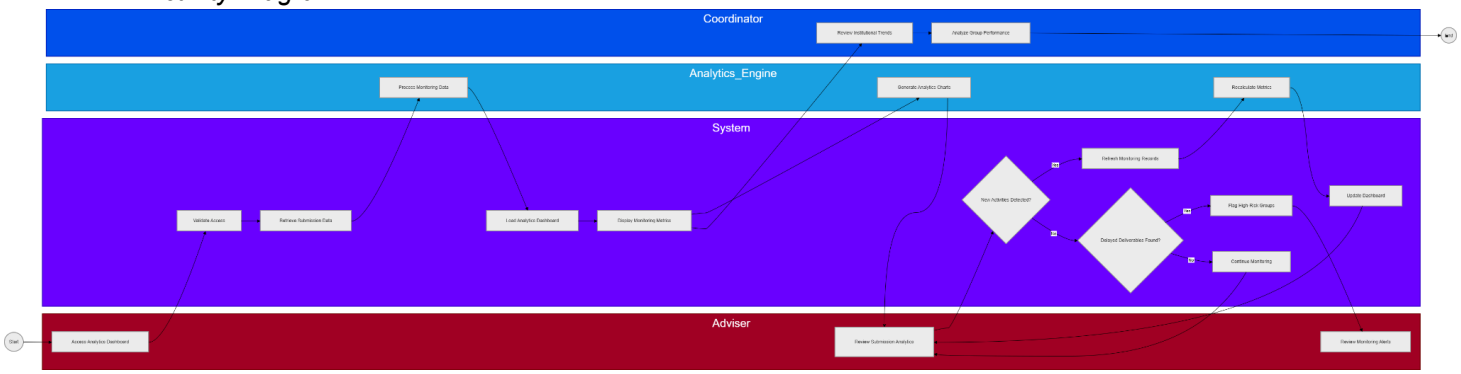

The system shall automatically detect submission-related events and monitor submission activity between uploaded deliverables.

The system shall update submission indicators and maintain version histories for all uploaded files. Generated insights shall help advisers and coordinators monitor progress, identify incomplete submissions, and detect significant changes in deliverable content.

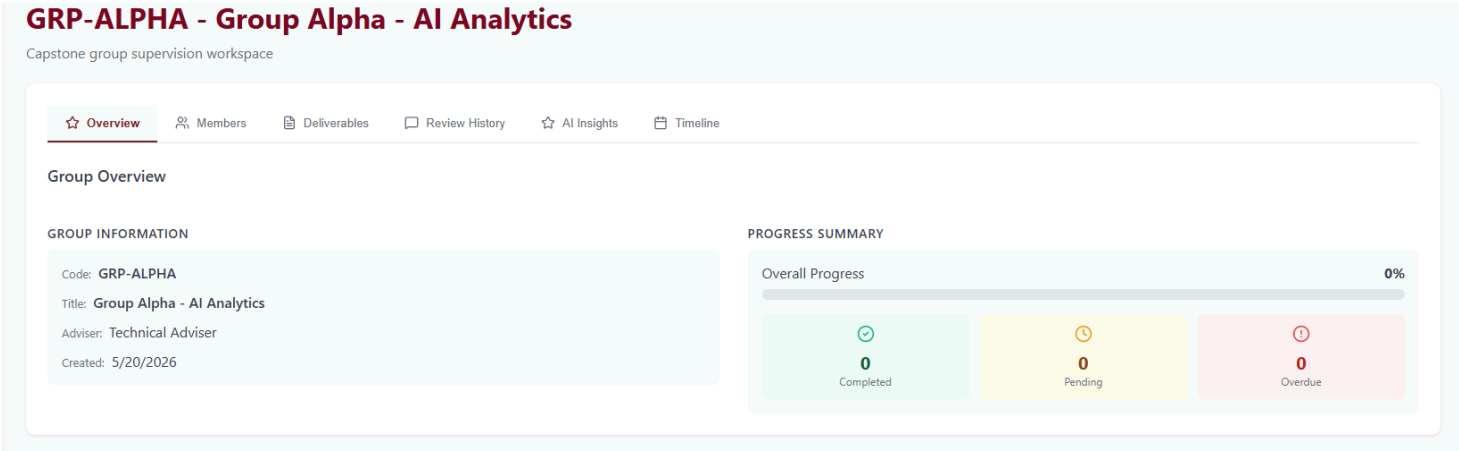

The system shall maintain analytical records and submission activity data to support

academic monitoring, project supervision, and institutional reporting.

- *Activity Diagram*

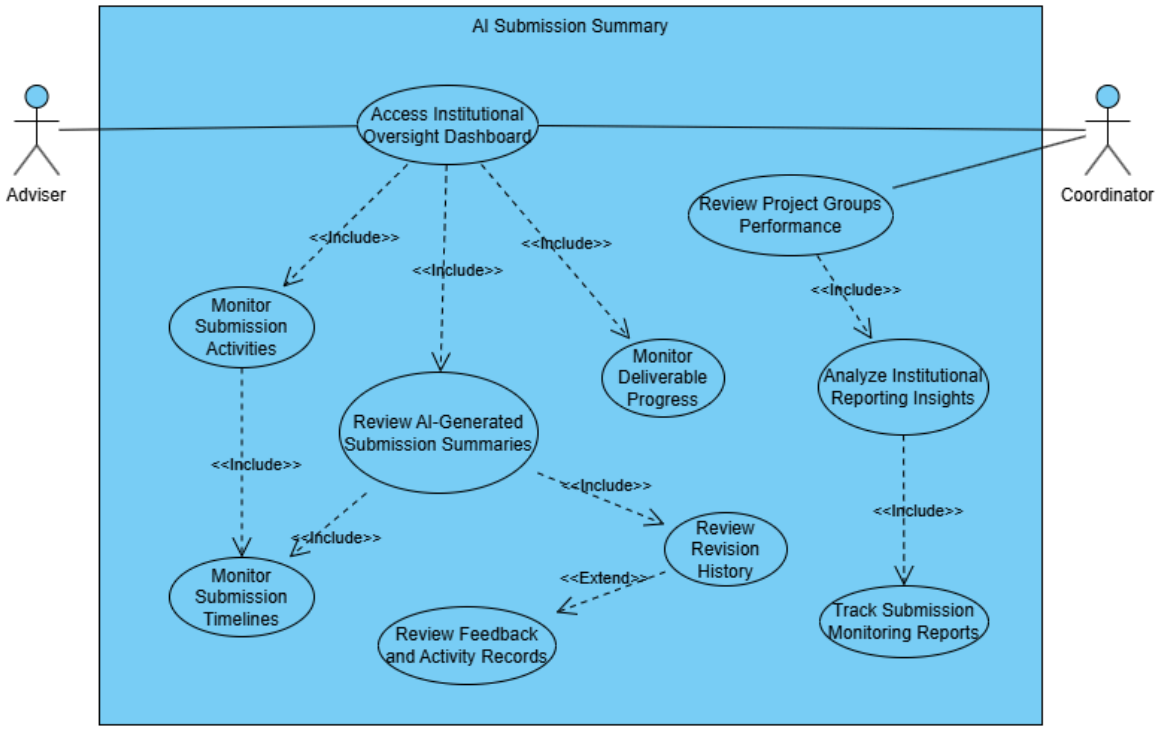

- *Wireframe*

*3.2 **AI Submission Summary***

- *Use Case Diagram*

Made with Visual Paradigm
For non-commercial use

- *Use Case Description*

The system shall provide AI-generated submission summaries for selected students, groups, or project teams. Advisers and coordinators shall be able to generate summarized reports that consolidate submission activities and progress information.

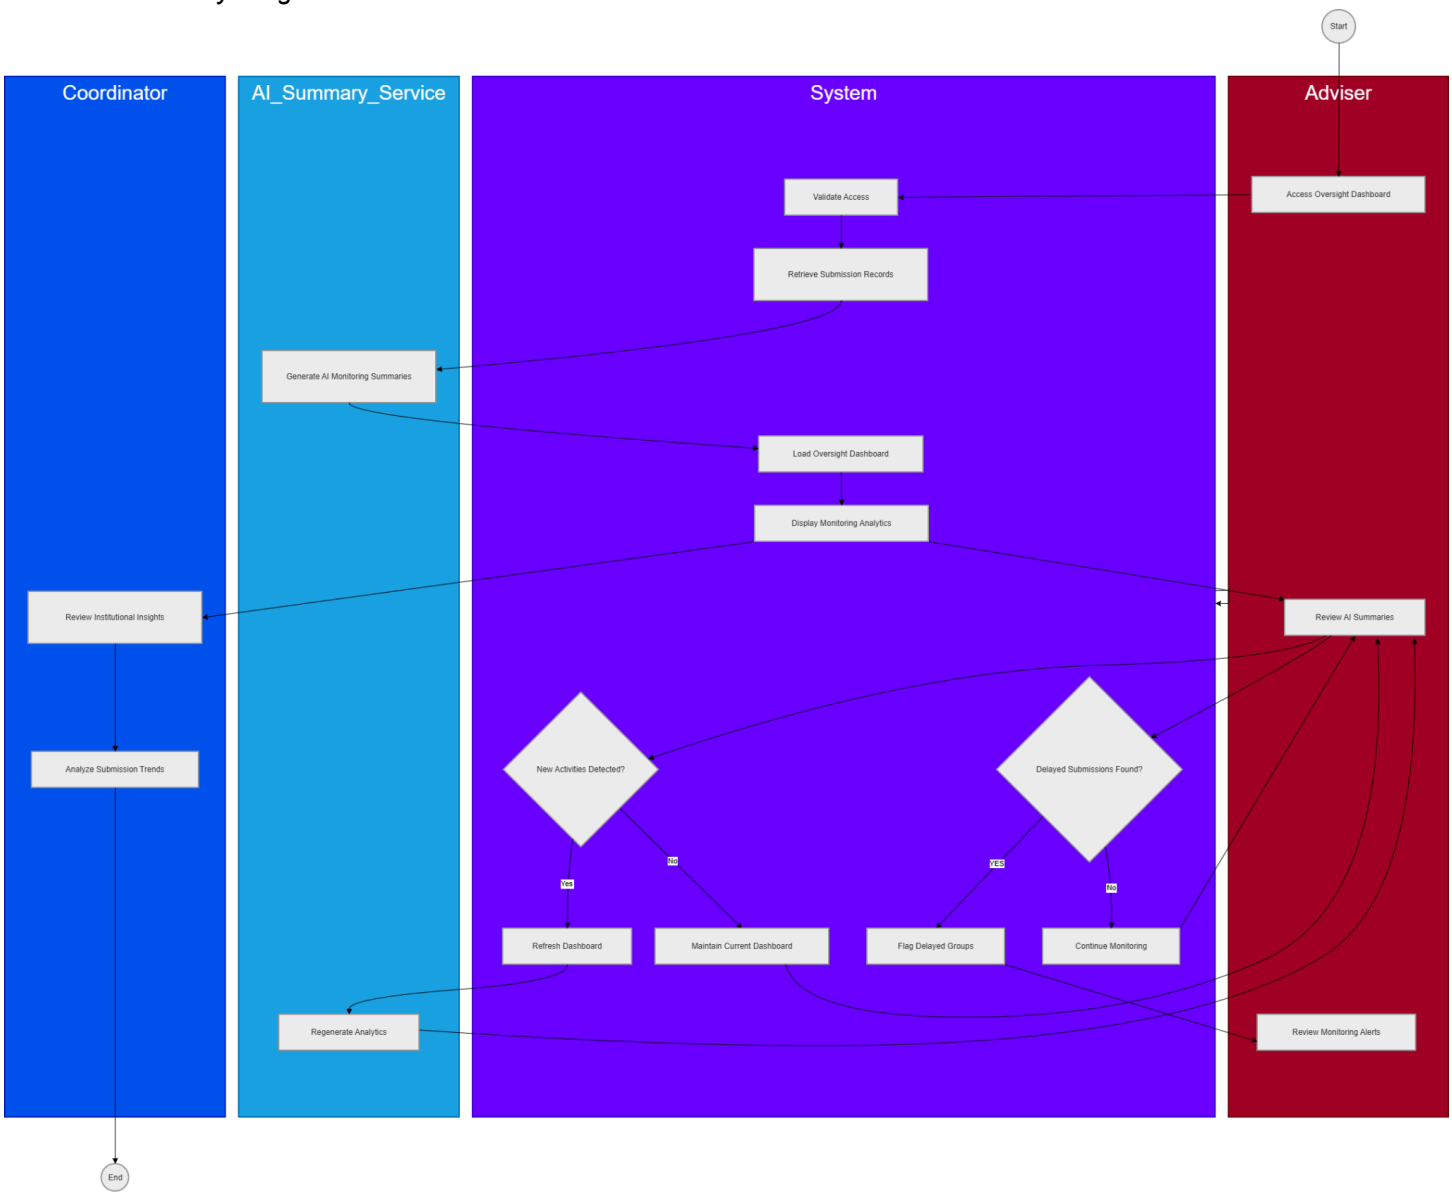

Upon selecting a target entity, the system shall retrieve related submission records, evaluate deliverable completion progress, and analyze submission timelines and statuses.

The system shall generate structured summaries containing information such as completed deliverables, pending submissions, overdue requirements, submission trends, and identified progress concerns.

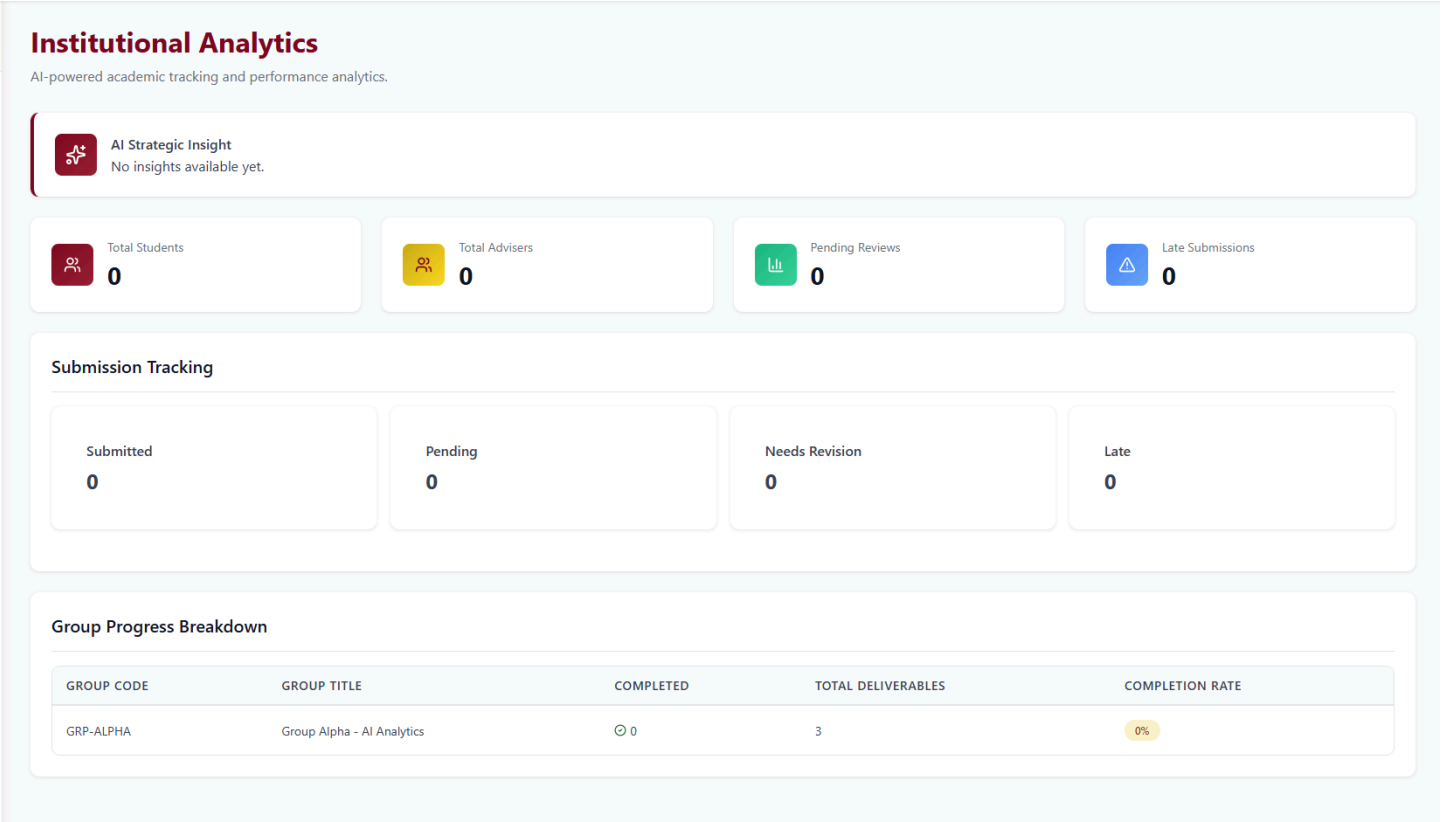

The AI-generated summaries shall assist advisers and coordinators in quickly reviewing project performance, identifying submission gaps, and supporting academic decision-making processes.

The system shall store generated summaries and reporting data for institutional documentation and monitoring purposes.

- *Use Case Description*

The system shall provide analytical reporting services that allow administrators to monitor submission performance and institutional compliance.

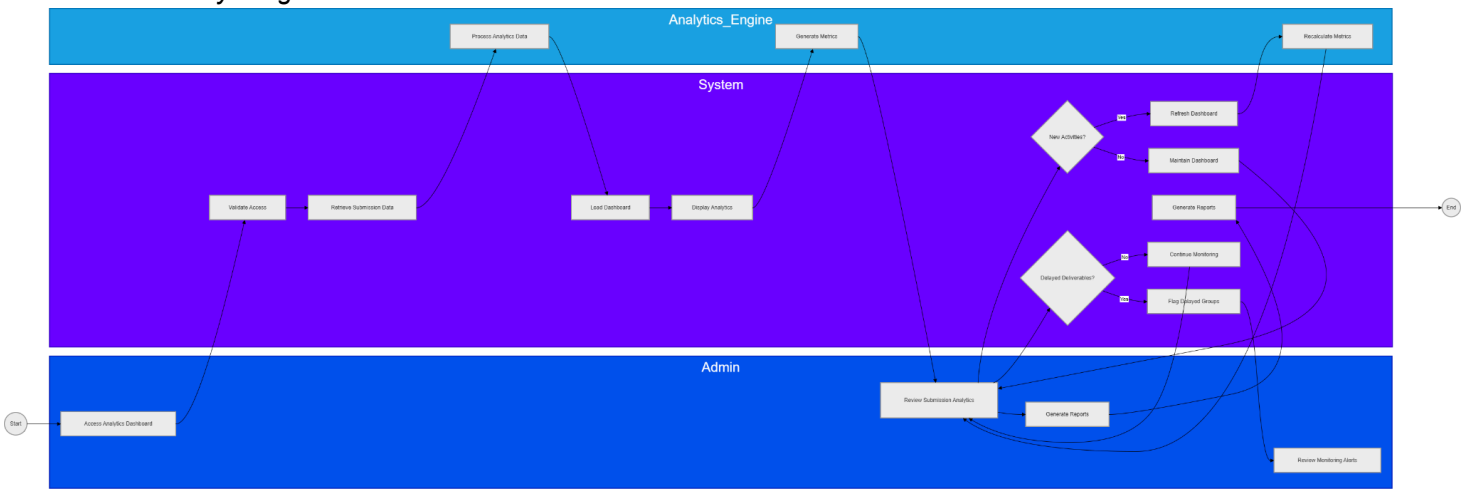

The system shall generate visual analytics and reports based on submission records, evaluation data, deadline compliance, and user activity information. Reports may include submission completion rates, overdue statistics, evaluation summaries, and project progress indicators.

Authorized users shall be able to filter reports according to student groups, departments, submission periods, project categories, and evaluation outcomes.

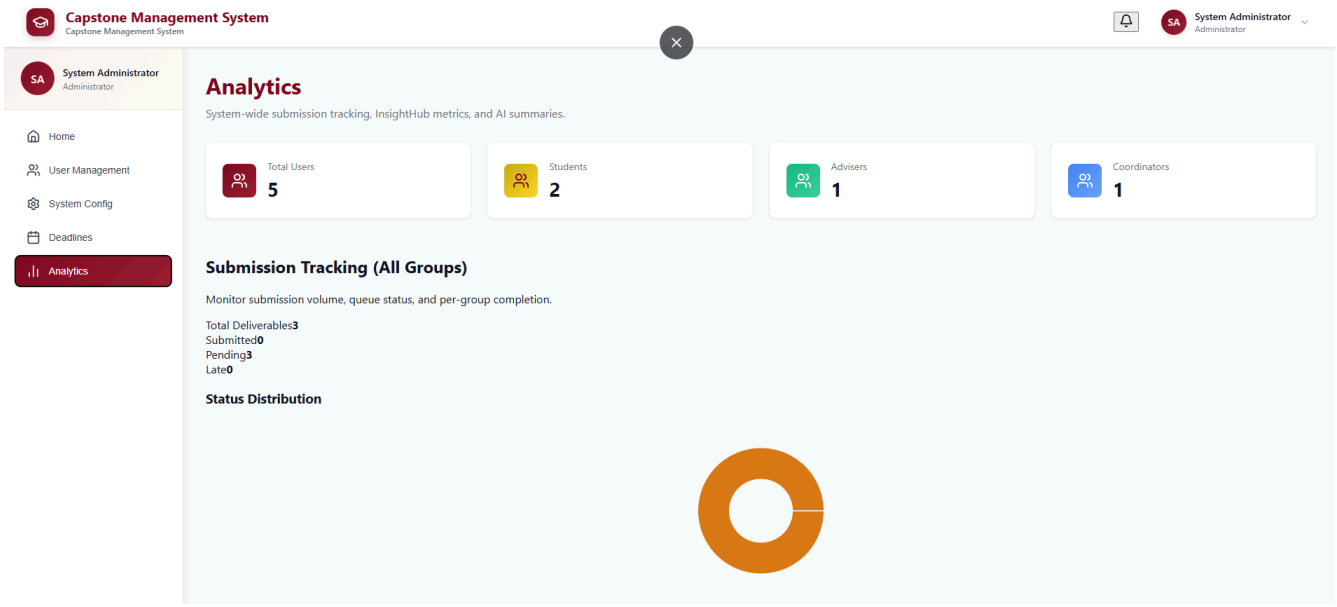

The system shall support report exporting and documentation functionalities for institutional review, academic monitoring, and administrative reporting purposes.

The system shall maintain historical analytics records to support long-term monitoring, performance evaluation, and institutional assessment activities.

- *Use Case Description*

  The system shall provide advisers and coordinators with a rubric-based evaluation and feedback management system for reviewing submitted deliverables.

  Advisers shall be able to:

  - Review uploaded submissions
  - Evaluate deliverables using predefined rubrics
  - Assign criterion-based scores
  - Provide textual feedback and recommendations
  - Approve or reject submissions

The system shall support detailed rubric configurations consisting of:

- Rubric categories
- Evaluation criteria
- Score allocations
- Assessment descriptions

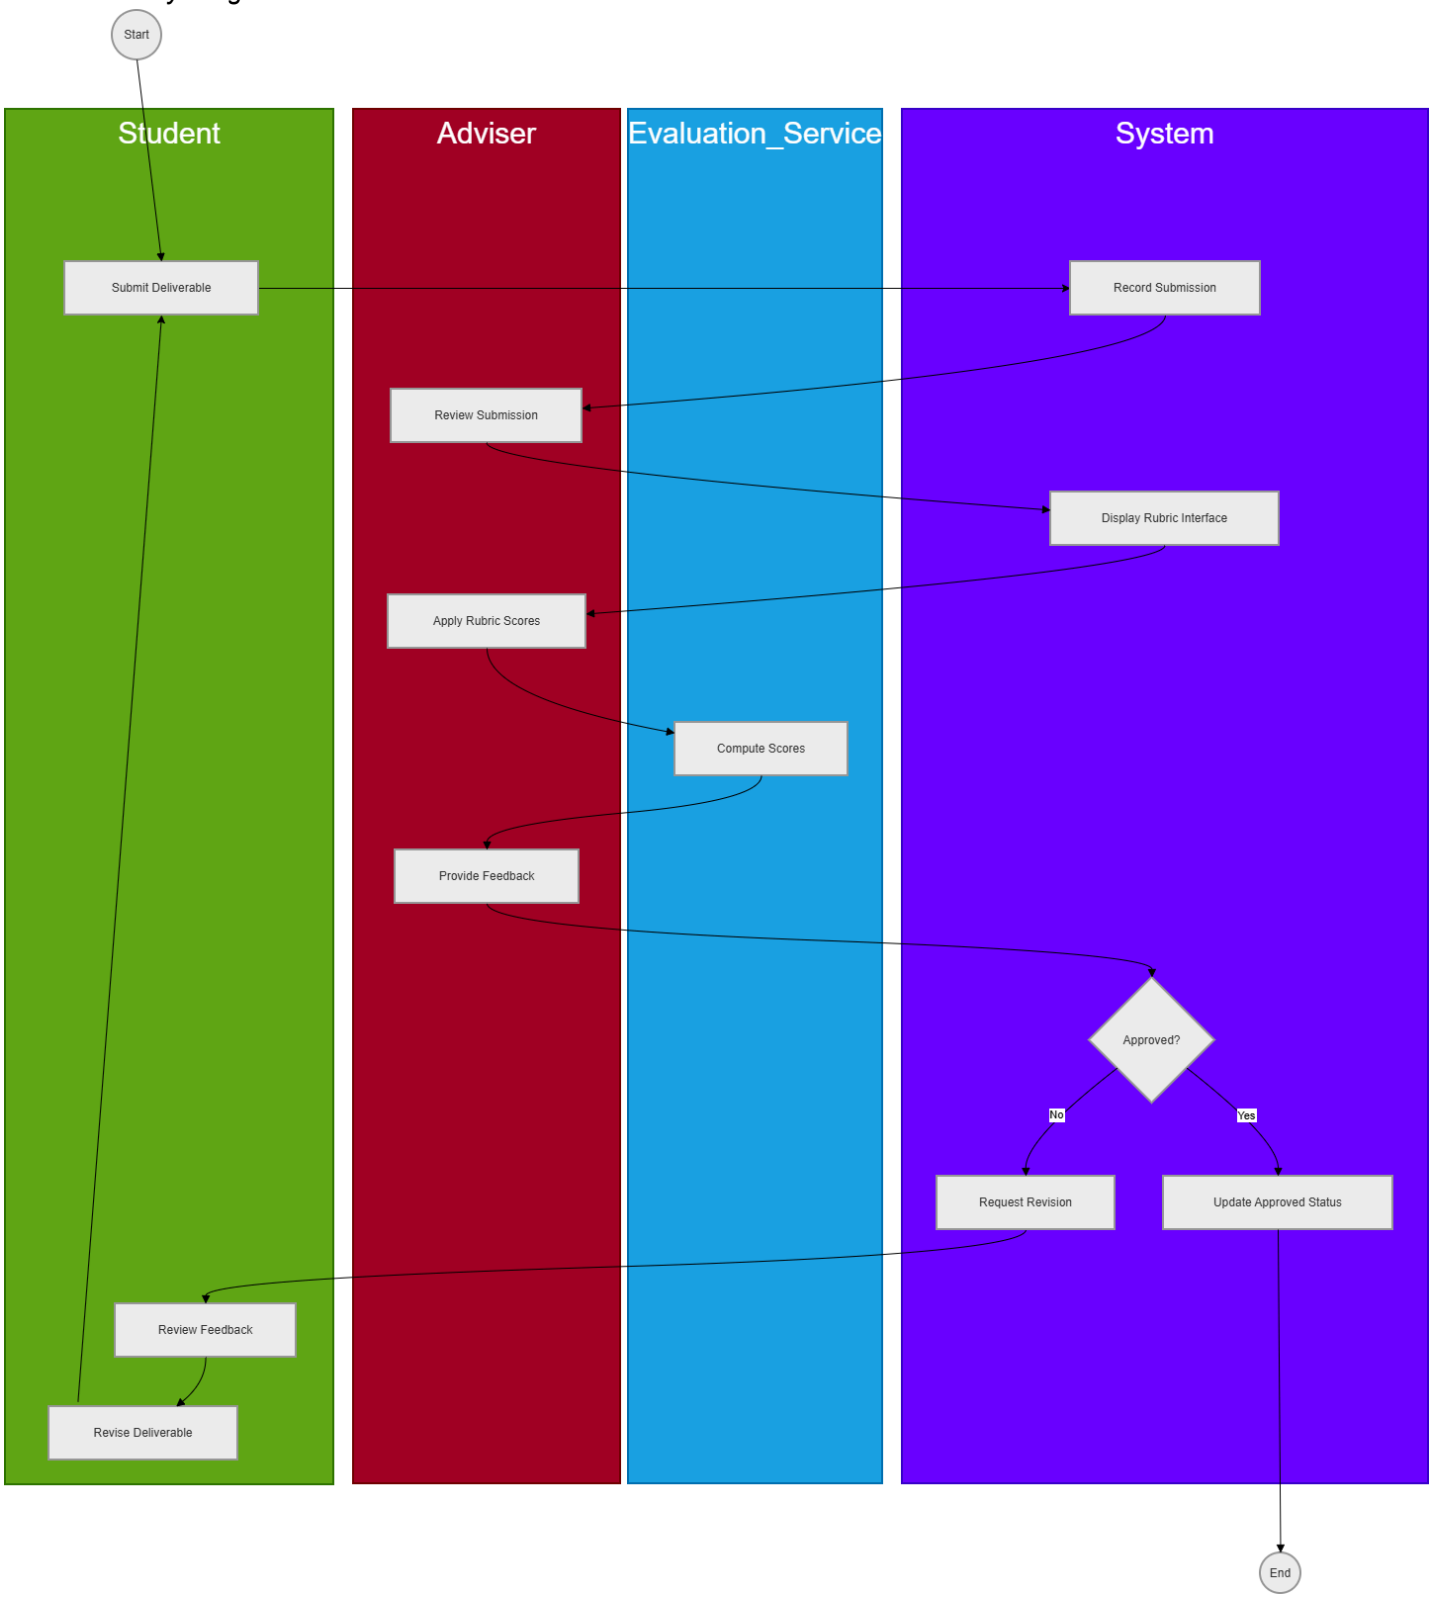

The system shall calculate evaluation scores automatically based on adviser-selected rubric criteria and store evaluation records within the database.

Students shall be able to:

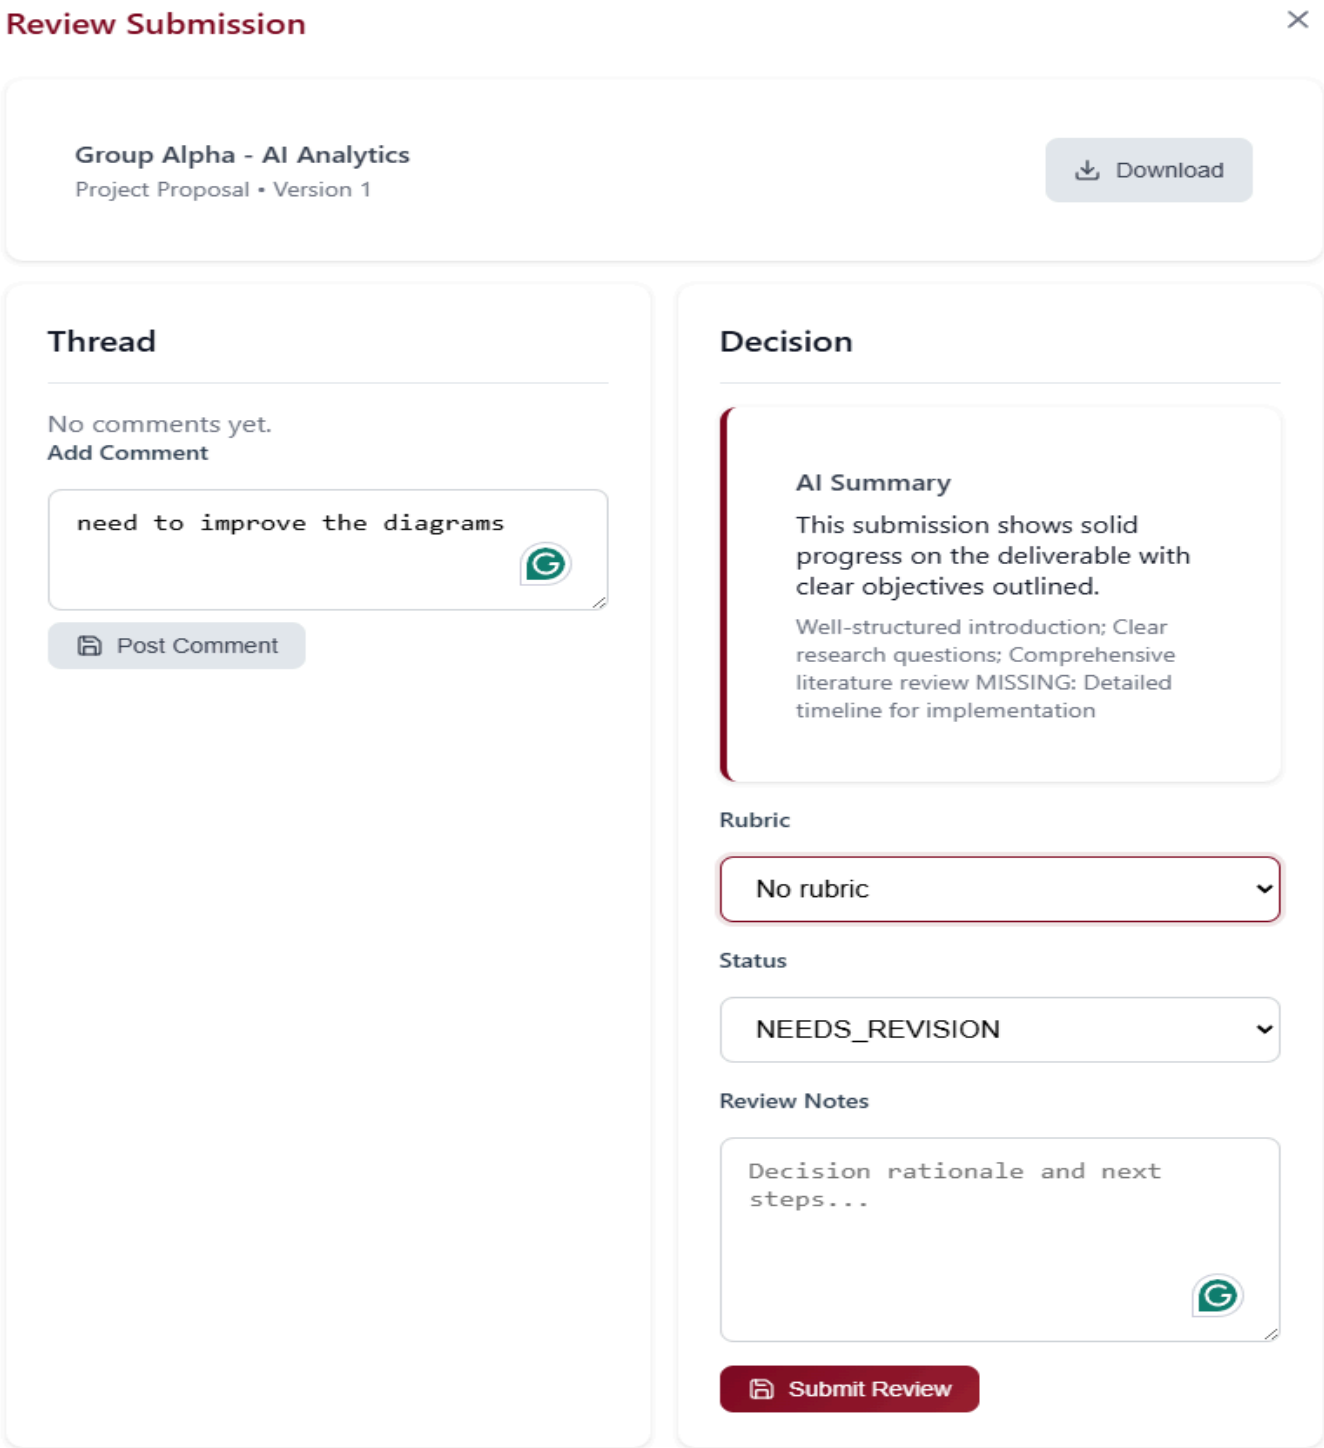

- View adviser evaluations
- Review rubric scores
- Access submission comments
- Monitor revision recommendations

The system shall maintain evaluation history and feedback records to support monitoring, accountability, and institutional documentation.

●.4 Non-functional requirements

Performance

- All major user interactions including login, dashboard loading, analytics retrieval, file upload, and submission monitoring must complete within 2 seconds under normal operating conditions.
- The system must support at least 1,000 concurrent users during peak academic periods without significant performance degradation.
- Real-time analytics dashboards must refresh monitoring data with less than 5 seconds data latency.
- Submission upload and version management operations must support large document uploads while maintaining stable system responsiveness.
- The cloud-based architecture must support future scalability without requiring major system redesign.

Security

- The system must implement end-to-end encryption for stored and transmitted data.
- JWT-based authentication and secure session management must be enforced for all authenticated users.
- Multi-Factor Authentication (MFA) must be supported for Adviser, Coordinator, and Administrator accounts.
- The system must strictly enforce Role-Based Access Control (RBAC).
- Audit logs must be protected against unauthorized modification or deletion.
- The system must detect and report suspicious submission activities and unauthorized access attempts.
- The system must comply with the Data Privacy Act of 2012 (Philippines).

Reliability

- The system must maintain 99.9% uptime excluding scheduled maintenance periods.
- Automated backup and recovery services must be implemented for submissions, analytics data, audit logs, and user records.
- Version-controlled submission management must prevent accidental file overwriting or data loss.
- Audit logging services must ensure integrity and traceability of monitored system activities.
- The system must maintain stable performance during peak submission periods and institutional monitoring operations.
